February, 1953

COSTS AND RETURNS FOR FEED CROPS

About 80 per cent of New York's 5,792,000 acres of harvested cropland are used for five feed crops (Table 1). Hay is grown on about 55 per cent of this area and is by far the most important crop. Oats are grown on the second largest portion of harvested cropland, covering 10 per cent, or nearly twice the acreage of any other small grain crop.

TABLE 1. HARVESTED ACREAGE OF HAY, GRAIN, AND CORN SILAGE
New York State, 1939 and 1949

Crop harvested	1939		1949	
	Thousands of acres	Per cent	Thousands of acres	Per cent
Hay	3,655	55.5	3,196	55.2
Oats	626	9.5	564	9.7
Corn Silage	433	6.6	437	7.5
Wheat	270	4.1	385	6.6
Corn Grain	188	2.9	163	2.8
Total	5,172	78.6	4,745	81.8
Acreage of cropland harvested	6,581	100.0	5,792	100.0

Source: U. S. Census

Corn silage is cut from 7 per cent of the harvested cropland. This is at a ratio of 1 acre of corn silage for every 9 acres of hay. Corn harvested for grain is grown on 3 per cent of the cropland. This is at a ratio of 1 acre of corn for grain for every 2 acres of corn harvested for silage.

A comparison of feed crop acreages for 1939 and 1949 shows no radical change in the production pattern for the 1940's. The acreage of wheat had increased by 115,000 acres during the 10-year period and occupied about 7 per cent of the land in 1949 as compared to 4 per cent in 1939. The percentage of cropland being used for corn silage and corn harvested for grain had also increased. The acreage and proportion of cropland kept in hay had decreased very slightly. High returns for wheat and corn for grain, and heavier demands for corn silage for dairy feed, were responsible for the changes in the production pattern.

From the standpoint of digestible nutrients, the production changes from 1939 to 1949 mean increased yields from the cropland growing feeds. Corn silage is the heaviest producer of total digestible

nutrients grown, producing almost 2 tons of digestible nutrients per acre (Table 2). This is almost twice the quantity produced by any other crop. Corn for grain makes the second greatest yield of digestible nutrients, commonly about a ton per acre. The three small grains--wheat, barley, and oats--rank in productive capacity in that order. Oats produces the least digestible nutrients of any of the principal feed crops.

TABLE 2 RELATIVE IMPORTANCE AND YIELDS OF TOTAL DIGESTIBLE NUTRIENTS FOR HAY, GRAIN, AND CORN SILAGE
New York State and Cost Account Farms, 1949

Item	New York State Farms	Cost Account Farms
Acres of cropland	8,484,763	4,790
Per cent of total cropland in:		
Hay	38.1	31.4
Oats	6.7	11.3
Wheat	4.5	12.2
Corn silage	5.4	7.2
Corn for grain	1.9	5.8
Barley	0.3	0.6
Total	56.9	68.5
Pounds of digestible nutrients per acre		
Corn silage	3,852	3,740
Corn for grain	1,986	2,031
Hay	1,219	1,632
Wheat	1,404	1,605
Barley	944	944
Oats	664	618

Source: Acreages from preliminary census, 1950; yields from U.S.D.A.
"Agricultural Statistics," 1950.

Hay is grown on a smaller proportion of the cropland on Cost Account farms than in the State as a whole (Table 2). The small grains, corn for grain, and corn silage occupy greater acreages. This means that production of total digestible nutrients per acre is somewhat higher for the Cost Account Farms than for New York Farms in general.

The tables which follow present the costs and returns in producing feed crops on New York Cost Account Farms in each year since 1914.
