# CORTLAND COUNTY FARM BUSINESS SUMMARY 1969

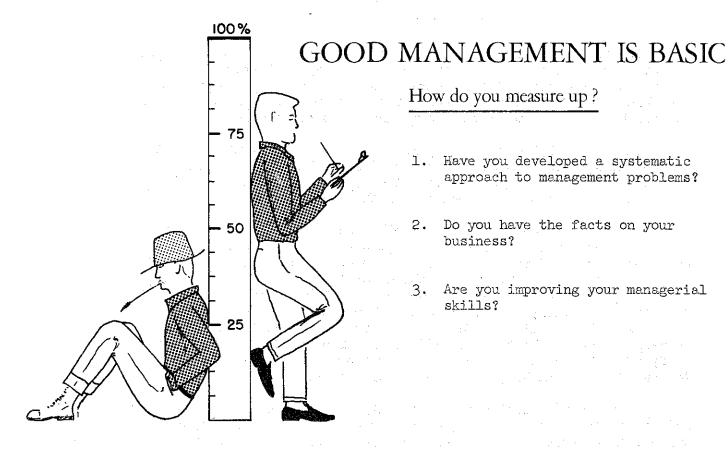

Each year for more than 10 years a group of Cortland County dairy farmers have cooperated in a farm business management program. Financial records of cooperating farmers have been summarized and analyzed with the objective of providing members of the group with standards of comparison by which to judge their own management performance.

Starting in 1959, membership in the group has varied between 13 and 30 farms, with a consistent turnover of membership, as farmers have been encouraged to participate for three years only. In 1969, 31 Cortland County farms were included in this summary.

Between 1960 and 1968, the number of dairy farmers in New York State decreased from approximately 40,000 to about 25,000. Projections based on this trend indicate that the number of dairymen in 1980 will be approximately 13,000. One of the major factors that will determine whether a dairymen of today is a dairyman in 1980 is his ability as a manager. Some dairymen will expand, others stay at about the same size and still others will quit farming. It is a callenge to each dairyman to decide upon the best course of action for himself and his family. A study of your business records and budgeting of some possible changes for the future will help you to make this decision.

The primary objective of these business management projects is to help cooperators do a better job of keeping and using records, and thus improve their skill as farm managers. The summary and analysis presented in this booklet should also be useful to farmers in Cortland County who are not enrolled in the business management projects, and to others connected with the agriculture of the County.

This summary was prepared by Robert S. Smith, Department of Agricultural Economics, New York State College of Agriculture, Cornell University, in cooperation with Ira Blixt and Carl Crispell, Cortland County Extension Service.

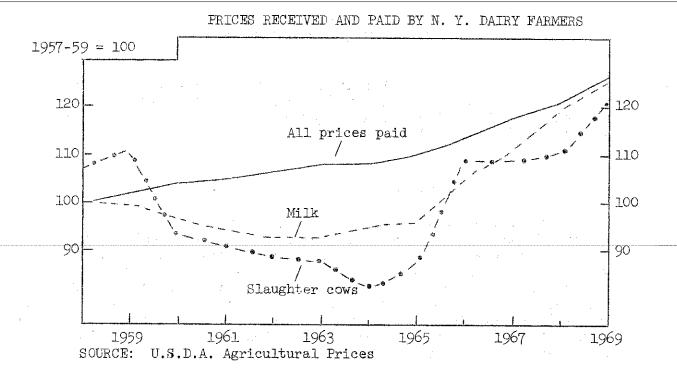

# How do you measure up?

- Have you developed a systematic approach to management problems?
- Do you have the facts on your business?
- Are you improving your managerial skills?

# Steps in making a management decision:

- Locate the trouble spot (problem)
- What is your objective? (goal) 2.
- Size up what you have to work with (resources) 3.
- Look for various ways to solve the problem (alternatives)
- Consider probable results of each way (consequences) 5.
- Compare the expected results (evaluate) 6.
- Select way best suited to your situation (decision) 7.
- 8. Put the decision into operation (action)

This workbook can help you!

Prices are one of the important factors affecting farm incomes. The relationship of prices received and prices paid determines the general level of farm incomes. The blended New York farm price for 3.5% milk in 1969 averaged \$5.67 per hundredweight. This was 24 cents higher than the average for 1968 and \$1.40 more than 1965. Cull dairy cow prices also were good in 1969. The overall index of prices paid by New York dairy farmers continued to rise in 1969.

In recent years, prices of some farm inputs have risen while others have declined. From 1965 to 1969, farm wages rose 35 percent, dairy cows rose 41 percent, while feed declined 3 percent, and fertilizer prices declined slightly. These differences give rise to management questions concerning substitutions.

AVERAGE YEARLY PRICES RECEIVED AND PAID BY N. Y. FARMERS, 1960-69

<sup>\*</sup> Preliminary

# PART I SUMMARY OF THE FARM BUSINESS

The first part of this booklet is designed to enable you to summarize your business in a systematic, orderly manner. It provides an opportunity to study your physical resources, capital investment, receipts, expenses and business income in depth.

# MANAGEMENT AND OTHER RESOURCES

We judge the manager of a business on the basis of how much net income he can make the business produce. But the resources a manager has or does not have may severely restrict his ability to produce. A farm manager with small amounts or low quality of land, livestock, equipment, labor, and capital cannot produce well when judged against a manager who has these resources in large amounts and high quality. Therefore, knowledge of what resources are available and how they are combined is fundamental to judging management performance. Below are listed some facts about the physical resources of this group of farms.

FARM ORGANIZATION

| Item                 | My farm<br>1969 | 31 Cortland Co.<br>farms, 1969<br>Average | Average of<br>568 New York<br>farms, 1968 |

<sup>\*</sup> Number of farmers that reported each crop.

#### CAPITAL INVESTMENT

Capital investment gives an indication of the capital resources available to the business manager. His ability to borrow is another part of his capital resource.

Management of the capital resource of a farm business is becoming increasingly important. To measure the complete financial progress of a dairy farm, year to year changes in the capital structure must be considered.

In this report borrowed as well as owned capital is included and the end of year farm inventory is used as the measure of capital investment.

FARM INVENTORY VALUES, END OF YEAR

|                      |                 | 31 Cort             | land Co.<br>1969    | Average of                  |

| Land and buildings   |                 | 50,818              | 45                  | 51,733                      |
| Total Investment     | \$              | \$114,294           | 100                 | \$111,935                   |

In many farm businesses, poor capital efficiency is a major cause of low profits. The following measures of capital efficiency will help you evaluate your overall capital management.

#### INVESTMENT ANALYSIS

| Total investment per man        | \$              | \$54,426                       | \$53,300                    |
| Total investment per crop acre  | \$              | \$ 762                         | \$ 722                      |
| Capital turnover*               | y               | rs. 1.9 years                  | 2.5 years                   |

<sup>\*</sup> Calculated by dividing the total year end investment by the total cash receipts for the year.

#### WHERE THE MONEY CAME FROM

A successful farm business requires a level of gross earnings great enough to pay all costs, both operating and overhead, and leave a margin for the operator's labor. Here we examine the sources of and total receipts for this group of dairy farms.

#### FARM RECEIPTS

|                       |                 | 31 Cortl            |                     | Average of                  |

| Miscellaneous*        |                 | 1,131               | 2                   | 1,301                       |
| TOTAL CASH RECEIPTS   | \$              | \$48,442            | 100                 | \$45,086                    |
| Increase in inventory |                 | 12,448              |                     | <u>8,161</u>                |
| TOTAL FARM RECEIPTS   | \$              | \$60,890            |                     | \$53,247                    |
| •                     | · <del></del>   |                     |                     |                             |

<sup>\*</sup> Includes work off farm, conservation payments, refunds, etc.

Total cash receipts amounted to \$48,442 per farm. The sale of milk, cull dairy cows and bob calves accounted for 97 out of every 100 dollars of cash receipts in this group of specialized dairy farms.

Increases in inventory resulting from more cows, more machinery and equipment, additions to buildings or a better feed situation are a normal occurence in most "going" farm businesses and are considered as farm receipts. These items could have been sold and turned into cash receipts, but instead the operator decided to invest this additional capital in his business. The cost of producing or acquiring these items is included in the farm expenses. For this group of farms, the net increase in inventory amounted to \$12,448 per farm.

# WHERE THE MONEY WENT

Some farmers may be able to increase profits by reducing costs. This requires a complete knowledge of what the business expenses are. With the large amount of cash flowing through a farm business today it is important that the farm operator study his expenses closely. Here is an opportunity for you to see how you are doing.

# FARM EXPENSES

#### FINANCIAL SUMMARY OF THE YEAR'S BUSINESS

The pay-off in management is in net income. There are several ways of measuring net income or profit for any business, including a farm. Large corporate businesses often express profit as net income before taxes, as net income after taxes, or as net income per dollar of sales. One of the best measures of profit for a farm business is labor income.

#### FARM INCOME AND LABOR INCOME

| Item                          | My farm<br>1969 | Average p<br>31 Cortland Co.<br>farms, 1969 |               |
|-------------------------------|-----------------|---|---------------|
| Average capital investment \$ | \$3             | 108,070 \$1                                 | 07,855        |
| TOTAL FARM RECEIPTS           | \$              | \$60,890                                    | \$53,247      |
| TOTAL FARM EXPENSES           |                 | 44,136                                      | <u>37,717</u> |
| FARM INCOME                   | \$              | 16,754                                      | 15,530        |
| Interest on capital at 7%     | *               | 7,565                                       | 7,550         |
| LABOR INCOME per farm         | \$              | \$ 9,189                                    | \$ 7,980      |
| Number of operators on farms  |                 | 35  | 610           |
| LABOR INCOME per operator     | \$              | \$ 8,262                                    | \$ 7,431      |

Changes in inventories during the year are included in figuring farm income and labor income. Increases in inventories due to expanding the business are considered as farm receipts and decreases in inventories are included as farm expenses. Interest payments and payments on debts are not included in the farm expenses.

"Farm Income" is the difference between total receipts, including inventory increases, and total expenses, including inventory decreases, but not interest paid. Farm income is really the amount provided by the business to pay for the use of all capital and the labor and management of the operator.

"Labor Income" is a measure used to determine the return the farm operator receives for his labor and management. It is the amount left after paying all farm expenses, and deducting a charge for unpaid family labor and for interest on the capital invested. To make all farms comparable, a seven percent interest charge on the average capital investment (average of beginning and end inventories) is deducted to get labor income. Labor income is the measure used most commonly when studying or comparing farm businesses.

Even in a very efficient and profitable dairy farm business, labor income can fluctuate markedly from year to year. Therefore, labor income over at least a three-year period should be studied before definite conclusions are drawn.

# FARM CASH OPERATING INCOME AND INCOME AVAILABLE FOR DEBT REPAYMENT

|   |                 | Average pe                     | r farm                      |
|---|-----------------|--------------------------------|-----------------------------|
| Item  | My farm<br>1969 | 31 Cortland Co.<br>farms, 1969 | 568 New York<br>farms, 1968 |
| Total cash farm receipts  | \$              | \$48,442                       | \$45,086                    |
| Total cash operating expenses                                     |                 | 28,543                         | 25,597                      |
| FARM CASH OPERATING INCOME  | \$              | \$19,901                       | \$19,489                    |
| Less: Family living expense                                       |                 | 6,097                          | 6,275*                      |
| Income available for debt repayment and purchase of capital items | \$              | \$13,80 <sup>1</sup> 4         | \$13,214                    |

<sup>\*</sup> Estimated at \$5,400 per operator per year. Some farms had more than one operator.

Farm Cash Operating Income indicates the cash available from the year's operation of the farm business for family living, interest and debt payments, and new capital purchases or investments. The income available for debt repayment and purchase of capital items is the amount provided by the business for purchase of new machinery, livestock, real estate and interest and debt payments.

Both of these measures help provide a picture of the "cash flow" of the farm business. They are not good measures of farm "profit" because changes in inventory are not included.

#### RETURN ON INVESTMENT

|                            |                 | Average per farm               |                             |  |
|----------------------------|-----------------|--------------------------------|-----------------------------|--|
| Item                       | My farm<br>1969 | 31 Cortland Co.<br>farms, 1969 | 568 New York<br>farms, 1968 |  |
| Farm income                | \$              | \$ 16,75 <sup>1</sup> 4        | \$ 15,530                   |  |
| Value of operator's labor* |                 | 6,097                          | 6,275                       |  |
| Return on Investment       | \$              | \$ 10,657                      | \$ 9,255                    |  |
| Average capital investment | \$              | \$108,070                      | \$107,854                   |  |
| Rate of return on capital  | %               | 9.9%                           | 8.6%                        |  |

<sup>\* \$5,400</sup> per operator. Some farms had more than one operator. Value of operator's labor excludes privileges.

Return on Investment is the average return to all capital invested in the farm business after a charge has been made for the value of the operator's labor. In the above calculation the operator's labor has been valued at \$5,400. Each farmer should use the value which, when added to the value of the use of his house and other privileges, equals what he could earn at another job.

# PART II ANALYSIS OF THE FARM BUSINESS

The key to success in farming is the overall management ability of the farm operator. This requires that he understand clearly, and more important apply the basic principles of farm management in making management decisions.

This section of the report presents guidelines for using these principles to help you analyze the profitability of your farm business. The "averages" presented provide useful standards for comparison whereby the relative strong and weak points and major problem areas of your business can be uncovered. Also presented are figures from the summary and analysis of New York dairy farms in 1968 and tables showing the basic relationship of various management factors to farm profits.

#### SIZE OF BUSINESS

There are some basic principles of farm management which a farm manager should recognize and use in making business decisions and in studying his business.

In general, large farms pay better than small farms. Larger farms make it possible to use equipment and other resources more efficiently. Further, if each hundredweight of milk is produced at a given profit, the more milk produced, the more profit. However, some 50 cow farms make larger incomes than others with 100 cows. This can happen when costs or other business factors are not in balance with the size of the farm business.

### MEASURES OF SIZE OF BUSINESS

|                 | Average per                 |  |
|-----------------|-----------------------------|--|
| My farm<br>1969 | 31 Cortland Co. farms, 1969 | 568 New York<br>farms, 1968              |
|                 | 59                          | 58                                       |
|                 | 739,200                     | 715,000                                  |
|                 | 2.1                         | 2.1                                      |
|                 | 669                         | 692                                      |
|                 | •                           | My farm 31 Cortland Co. 1969 farms, 1969 |

In the following table, the 568 New York dairy farms have been sorted into various size groups. For each size group the average labor income per operator is shown. Sorting the farms in this manner shows the relationship between size of business and farm profits.

COWS PER FARM AND LABOR INCOME 568 New York Dairy Farms, 1968

| Number  | Number   | Percent   | Labor income  |
|---|--|---|---|
| of cows   | of farms                                       | of farms  | per operator  |
| Less than 25 25 - 39 40 - 54 55 - 69 70 - 84 85 - 99 100 - 114 115 - 129 130 and over | 13<br>126<br>193<br>98<br>52<br>34<br>24<br>16 | 3<br>22<br>3 <sup>1</sup> 4<br>17<br>9<br>6<br>4<br>3 | \$ 3,080<br>6,080<br>7,230<br>9,920<br>10,400<br>11,800<br>14,850<br>20,410<br>19,270 |

# RATES OF PRODUCTION

High rates of production of both animals and crops are very important to the success of a farm business. However, when high crop and animal yields are achieved without regard to cost, net income is reduced. In general, it pays to increase yields up to the point where the last unit of input (such as feed or fertilizer) is just paid for by the increase in output due to this last unit of input. Relatively few farmers have reached the point where the cost of an added input into milk or crop production is equal in value to the additional output.

# MEASURES OF RATES OF PRODUCTION

|                              |                 | Average per                    | farm                        |
|------------------------------|-----------------|--------------------------------|-----------------------------|
| Measure                      | My farm<br>1969 | 31 Cortland Co.<br>farms, 1969 | 568 New York<br>farms, 1968 |
| Pounds of milk sold per cow  |                 | 12,400                         | 12,300                      |
| Tons of hay per acre         |                 | 2.2                            | 2.8                         |
| Tons of corn silage per acre |                 | 13                             | 14                          |
| Bushels of oats per acre     | <u> </u>        | 60                             | 61,                         |

## DISTRIBUTION OF PRODUCTION PER COW 31 Cortland County Farms, 1969

| Pounds of milk sold per cow | Number o | f farms |
|-----------------------------|----------|---------|
| Under 10,000                |          | 2       |
| 10,000 - 10,999             |          | 6       |
| 11,000 - 11,999             |          | 7       |
| 12,000 - 12,999             |          | 3 ·     |
| 13,000 - 13,999             |          | 5       |
| 14,000 and over             | 1        | 8       |

The relationship of production per cow to labor income on three sizes of farms is shown in the following table for the 568 New York dairy farms in 1968

MILK SOLD PER COW AND LABOR INCOME 568 New York Dairy Farms, 1968

| Pounds of milk sold per cow | Number   | Number  | Feed bought | Labor    |
|-----------------------------|----------|---------|-------------|----------|
|                             | of farms | of cows | per cow     | income   |
| Under 10,000                | 58       | 55      | \$124       | \$ 4,250 |
| 10,000 - 10,999             | 66       | 56      | 130         | 6,990    |
| 11,000 - 11,999             | 112      | 56      | 150         | 7,880    |
| 12,000 - 12,999             | 133      | 60      | 169         | 9,670    |
| 13,000 - 13,999             | 112      | 62      | 173         | 10,240   |
| 14,000 and over             | 87       | 58      | 198         | 11,560   |

#### LABOR EFFICIENCY

Labor efficiency has a strong influence on the profits of any business and is becoming increasingly important on dairy farms, This is in part due to a steady increase in the substitution of machinery for labor and also increased adoption of new technology. Here we will examine several measures of labor efficiency, the most important one to dairy farmers being milk sold per man.

# MEASURES OF LABOR EFFICIENCY

|                             |  | Average per                    | farm                        |
|-----------------------------|--|--------------------------------|-----------------------------|
| Measure                     | My farm<br>1969                          | 31 Cortland Co.<br>farms, 1969 | 568 New York<br>farms, 1968 |
| Number of cows per man      |  | 29                             | 28                          |
| Pounds of milk sold per man |  | 356,200                        | 341,000                     |
| Work units per man          | الغيبيا المنافعة مربر وخمي المسجودين خمش | 319                            | 330                         |

## DISTRIBUTION OF MILK SOLD PER MAN 31 Cortland County Farms, 1969

| Pounds of milk sold per man | Number of farms            |
|-----------------------------|----------------------------|
| Under 300,000               | 7                          |
| 300,000 - 399,999           | 16                         |
| 400,000 - 499,999           | $\mathcal{I}_{\downarrow}$ |
| 500,000 and over            | . 4                        |

The relationship between milk sold per man and labor income is illustrated in the table below. Clearly the effect of labor efficiency on labor income is strong.

## MILK SOLD FER MAN AND LABOR INCOME 568 New York Dairy Farms, 1968

| Pounds of milk sold per man | Number<br>of farms | Number<br>or cows | Lbs. milk per cow | Labor income<br>per operator |
|-----------------------------|--------------------|-------------------|-------------------|------------------------------|
| Under 200,000               | 29                 | 47                | 9,800             | \$ 2,504                     |
| 200,000 - 299,999           | 172                | 49                | 11,600            | 5,731                        |
| 300,000 - 399,999           | 196                | 57                | 12,400            | 8,893                        |
| 400,000 - 499,999           | 119                | 65                | 12,900            | 11,462                       |
| 500,000 and over            | 52                 | 87                | 13,400            | 16,627                       |

#### COST ANALYSIS

Keeping costs in line is one of the most important factors affecting farm profits today. This does not mean cutting costs to the point of reducing efficiency, but keeping on the lookout for unnecessary or unwise expenditures. Since feed, machinery and labor account for the lion's share of farm expenses, these cost items should be studied in detail.

#### FEED COSTS

Feed bought is the largest single expense item on most dairy farms. The success of a dairy farm manager depends to a large degree on his ability to provide a good feeding program for his herd at reasonable cost. Because the feeding program includes both purchased and homegrown feed, and both roughage and concentrates, it is not easy to locate the week spots in efforts to control feed costs. The items on this page all have a bearing on feed costs, and may be helpful in planning a more efficient feeding program.

| Total acres in crops per cow        | - v.a                       | 2.5 acres                      | 217 acres                   |
| Lime & fertilizer expense/cow       | \$                          | \$ 31                          | \$ 30                       |
| Lime & fertilizer expense/crop acr  | e \$                        | \$ 12                          | \$ 11                       |
| Number of heifers per 10 cows       |                             | 7.3                            | 6.9                         |
|                                     |                             |                                |                             |

The above measures of harvested roughage consider only the quality. Quality is also significant and has a bearing on purchased feed and milk production. Such tings as overall quality, date first cutting was completed, percent legumes in the hay, and maturity of silage should be considered in evaluating and adjusting your roughage program.

### POWER AND MACHINERY COSTS

Successful farm managers have substituted power and machinery for labor to a large degree. As this process continues, it is vitally important to retain control of the costs associated with owning and operating farm equipment. For this group of farms, power and machinery costs were about 21 percent of the total farm expenses.

<sup>\*</sup> Does not include insurance, housing, or value of farm labor used in operation or repair.

### LABOR AND MACHINERY COSTS

Most farm operators justify major machinery purchases as a way to save labor and increase productivity. How well labor and machinery are combined has an important bearing on farm profits.

<sup>\*</sup> These farms are considerably above the average for all farms in New York State. For example, the median number of cows for the 568 farms was 50 compared with 36 for all farms in the State.

The Farm Business Chart is a tool which can be used in analyzing a business to determine the strong and weak points. The chart shows how far the individual farm is above or below the midpoint of the 568 farms for each factor.

The figure at the top of each column is the average of the top 10 percent of the farms for that factor. For example, the figure 4.0 at the top of the column headed "Man equivalent" is the average man equivalent on the 10 percent of the farms with the most men. The other figures in each column are the average for the second 10 percent, third 10 percent, etc. The figure at the bottom of each column (1.1 for Man equivalent) is the average for the 10 percent of the farms which ranked lowest in that factor.

Each column of the chart is independent of the others. The farms which are in the top 10 percent for one factor would  $\underline{not}$  necessarily be the same farms which make up the top 10 percent for any other factor.

This chart is used in analyzing a particular dairy business by drawing a line through the figure in each column which shows where the farm being analyzed stands for that factor. This helps identify the strengths and weaknesses. Summarize these and list them at the bottom of page 17.

### Farm Business Chart contd.

The cost control factors are ranked from low to high. For cost control factors, the lowest cost is not necessarily the most profitable. In some cases, the "best" might be somewhere near the average. Many things affect the level of these costs, and these items must be taken into account when analyzing the factors.

FARM BUSINESS CHART FOR FARM MANAGEMENT COOPERATORS 568 New York Dairy Farms, 1968

| Cost Control |           |               |           |  |  |  |
|--------------|-----------|---------------|-----------|--|--|--|
| Feed.        | % Feed is | Feed and      | Machinery |  |  |  |
| bought       | of milk   | crop expense  | cost      |  |  |  |
| per cow      | receipts  | per cwt. milk | per cow   |  |  |  |
| \$ 69        | 71%       | \$1.01        | \$ 87     |  |  |  |
| 103          | 11%<br>16 | 1.27          | 106       |  |  |  |
| 125          | 20        | 1.44          | 117       |  |  |  |
| 145          | 22        | 1.55          | 129       |  |  |  |
| 160          | 24        | 1.65          | 140       |  |  |  |
| 173          | 26        | 1.74          | 150       |  |  |  |
| 185          | 28        | 1.84          | 162       |  |  |  |
| 201          | 30        | 1.93          | 177       |  |  |  |
| 218          | 31        | 2.07          | 195       |  |  |  |
| 262          | 37        | 2.38          | 241       |  |  |  |

Based on the analyzed results shown on the business chart, list below the strong and weak points of the business. Then identify the major problems.

| STRONG POINTS:  | WEAK POINTS: |
|-----------------|--------------|
|                 |              |
|                 |              |
| MAJOR PROBLEMS: |              |
|                 |              |

After identifying problems, consider alternative ways of solving each problem. Each alternative should be studied in detail. A budgeting form can be used for projecting the likely results of each alternative.

#### III. Additional forward planning steps and pointers

- 1. List new capital items associated with the change including land, buildings, machinery and cattle. Estimate their cost.
- 2. Estimate changes in receipts and expenses (Part IV) considering all input and production items that are affected by the change under consideration. Adjust present figures if anticipated price changes are used in the budget.
- 3. When analyzing the effects of the proposed change, fulfillment of non-monetary goals may be considered.
- 4. More than one alternative change should be considered.

# Selected Competitive Dairy Areas

A good manager aims to know how his business stands in relation to his competition both at home and in other dairy areas. The table below presents data from four states. These data were taken from reports on farm business management projects similar to the ones in New York. Some measures have been adjusted so that they are comparable for the four states.

To properly analyze your farm business, more than one year's records are needed. Three or more years records will help you determine what progress you are making and what is normal for your farm. In the table below fill in the figures for your business for the last three years and study your progress.

# THE DAIRY INDUSTRY IN NEW YORK STATE -- 1960 to 1980

In 1960, the Department of Agricultural Economics at Cornell University initiated a research study of the changes in milk production in the New York Milkshed.\* A random sample of farms was selected. Sample farms were visited each year from 1960 to 1964 and again in 1967 to gather information on changes that had taken place. In 1965, 1966, and 1968, some information was obtained with a mail questionnaire. A return of over 90 percent was experienced by mail each year.

The sample of farms studied included a 2.5 percent sample of the dairy farms in the New York Milkshed and a 5 percent sample of the Hudson Valley area. Farms delivering to all markets in New York State, and those located in New York State but delivering to New England markets were included. The sample included 1,073 farms in 1960.

From this sample of farms an estimate can be made of the number of producing units, number of milk cows, and number of heifers in New York State for each year from 1960 to 1968.
