It is the policy of Cornell University actively to support equality of educational and employment opportunity. No person shall be denied admission to any educational program or activity or be denied employment on the basis of any legally prohibited discrimination involving, but not limited to, such factors as race, color, creed, religion, national or ethnic origin, sex, age or handicap. The University is committed to the maintenance of affirmative action programs which will assure the continuation of such equality of opportunity.

## QUARTERLY 1987 NORTHEAST FARMLAND VALUES

Loren W. Tauer

L.W. Tauer is an associate professor, Department of Agricultural Economics, Cornell University. Darlene Jennings and Renee Hoffman assisted in the survey. Professor B.F. Stanton helped to organize the project and assisted in data collection. The project was funded with a cooperative agreement with the RTD, ERS, USDA (#58-319V-4-00233). The RTD researcher was William Heneberry.

## Quarterly 1987 Northeast Farmland Values

### Introduction

Farmland values in the U.S. increased steadily with only minor regional variations from 1933 to the early 1970's (Jones and Barnard). Beginning in 1972 the prices for most farm commodities increased substantially ushering in the start of a major farm boom. Given that farm income had risen continually since the mid-50's, higher earnings appeared to be more than a temporary phenomena. This new level of income, and strong expectations of continued gains, was subsequently translated into rapidly rising asset values, especially real estate. Farmers saw their equity grow as a result, but maintenance of this new wealth demanded earnings to continue rising in accordance with growth in expectations.

The present decade has changed these relationships as income has fallen and prospects for future growth dimmed. As a result, increasing land values were brought to a halt in 1981 along with the associated generation of farm wealth. Dramatic decreases from 30 to 50 percent in farmland values have occurred in some Midwestern regions heavily dependent on agriculture, while in other areas, land prices have actually increased reflecting the income potential available in non-agricultural uses. The Northeast states represent a continuum of these alternative scenarios.

Further changes in farmland values will occur as income prospects and interest rates move toward equilibrium in the market with the direction of change reflecting the future use of the land. To monitor changing farmland values for the Northeast, the Department of Agricultural Economics, Cornell University, in cooperation with the USDA, established a quarterly farmland survey in 1985. This report contains the summarized results of the four quarterly surveys that were completed on the Northeast states during 1987.<sup>1</sup>

### Procedure

The project began in late 1984 with the contact of prospective survey participants. Individuals such as realtors, appraisers and agricultural credit personnel were contacted through a variety of techniques but the primary method was and continues to be by mail. When the first survey was sent in early January 1985, sixty-four people had agreed to participate in a quarterly survey of farmland values. They provided information about values in the states of Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York and Vermont. No participant has been located in Rhode Island.

During 1985 and 1986 the survey was designed to ask respondents the average value of farmland in their area. The quarterly surveys were mailed the first of January, April, July and October to elicit farmland

---

<sup>1</sup>The project will continue in 1988 with the methodology used in 1987.

values for the first of each of those months. Those results are published in Tauer, and Tauer and Weersink.

For 1987 a different approach was utilized. In the fall of 1986 each active respondent was asked to specify and describe a benchmark tract of farm real estate. Each quarter during 1987 the respondent was asked to estimate the market value of that benchmark real estate. Shifting to a benchmark approach allowed tracking changes in those benchmark tracts which should be more indicative of consistent farmland value changes than asking respondents to report on "average" farmland values or the result of recent sales in the area.

Again for 1987 the quarterly surveys were mailed the first of January, April, July and October to obtain reports of estimated values for the first of each of those months. Participants were asked to return their response by mail. If no reply had been received in two weeks a follow-up survey was sent. The majority of participants responded every quarter.

Attached are the descriptions of the benchmark real estate tracts provided by each participant and their estimated values for each quarter. Respondents are identified by I.D. number only. Identification numbers with letter addenda indicate those respondents provided information for more than one benchmark tract.

The January 1987 survey also included questions concerning changes in supply and demand, transactions, and composition of buyers and sellers. The results are reported in Tables 1 through 4, and the survey questions are contained in an Appendix. Similar questions were asked during 1985 and 1986 and those results can be found in Tauer, and Tauer and Weersink.

State New York County(ies) Chenango

Type of farm 70 cow upland dairy farm

Total number of acres 227 (divide into the 6 listed categories below)

1. Acres of cropland 125

Principal crops hay (legume) Expected yield/acre 3.5

corn 16 tons

2. Acres of forest 15

3. Acres of permanent pasture 82

4. Acres of orchards \_\_\_\_\_

Fruit and variety \_\_\_\_\_ Expected yield/acre \_\_\_\_\_

5. Acres of vineyards \_\_\_\_\_

Variety \_\_\_\_\_ Expected yield/acre \_\_\_\_\_

6. Other acreage 5 Description: Farmstead

**Predominate soil characteristics**

Topology: level \_\_\_\_\_ moderate sloped X steeply sloped \_\_\_\_\_

Drainage: well \_\_\_\_\_ moderate X to poor \_\_\_\_\_

Lime: high acid X low acid \_\_\_\_\_ neutral \_\_\_\_\_

Predominate soils Mardin silt loam with some Lorelstown

Capacity of barn 70 cows Description of barn Tie stall barn with 2

25 heifers, 12 calves other upright and 2 harvestors. Manure lagoon

Size and condition of house 80 yr. old house, remodeled and well maintained.

Modern kitchen, 7 rooms total, 2,100 ft. of living space.

Other buildings (including other houses) Small tool shed with open front.

Little contributory value.

Other information (i.e. development pressures and restrictions) Good dairy farm on dirt road. Limited number of farms on road may eventually effect availability of milk pickup
