ACKNOWLEDGEMENT C. A. Bratton, G. L. Casler, C. W. Loomis, R. S. Smith, and L. A. Stantwith the assistance of county agricultural agents in 38 counties supervised	on d

with the assistance of county agricultural agents in 38 counties supervised the farm business management projects and the records which made this summary and analysis possible.

In 1961, farmers in 38 New York counties cooperated in Farm Business Management Projects. These projects were sponsored jointly by the County Agricultural Extension Services and the Department of Agricultural Economics at Cornell.

Part of the purpose of these projects is to teach farmers to keep better records. A more important purpose is to teach the farmers how to analyze these records and use them as a basis for improving the farm business. In total, the aim is to help farmers improve their management ability to enable them to compete in today's commercial agriculture.

Each farm family whose record is included in this summary took a farm inventory at the beginning and end of 1961. During the year they recorded receipts and expenses and certain other information such as crop acreages and yields. At the end of the year, each record was checked by a county agricultural agent or farm management specialist. Farm business summaries were prepared for the cooperating group of farmers in each county.

The averages presented here \underline{do} not represent the average for all the dairy farms in the state. Enrollment by the farmers is voluntary. As a group, the farmers are somewhat better than the average dairy farmers in the state.

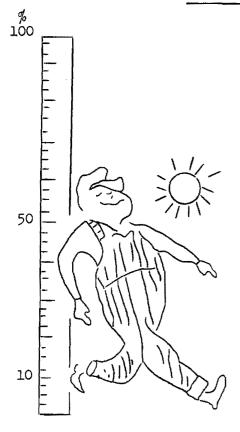

The records from 24 counties were summarized and analyzed at Cornell. In the other 14 counties, the farmers summarized their own records but these were analyzed and the summary reports prepared at Cornell. A total of 1,057 records were summarized from farms that had dairy herds. The 633 records from the 24 counties summarized at Cornell have been combined into a general summary for special analysis.

These 633 farms all had commercial dairy herds. On many farms there were other enterprises in addition to dairy. Farms with large receipts from either egg, fruit, or cash crop sales, rented farms and farms with large amounts of non-farm income were separated from the specialized dairy farms. The number of farms in each group was: 490 dairy; 25 dairy-poultry; 19 dairy-fruit; 49 dairy-cash crops; 17 dairy-renters; 26 part-time dairy farms, and 7 unusual farms. Many of the farmers in the part-time group had large farm businesses but on each there was a large amount of off-farm work and income.

The individual farm records are confidential. The averages are widely used by extension workers, vocational agriculture teachers, and others interested in agriculture. This summary has been prepared primarily for their use. The farmers in each county farm management group have already received copies of their county summary. However, these and other farmers may have use for this summary. Blank spaces have been provided to allow filling in of individual farm figures.

This publication has been divided into four major sections. The first section is a summary of the farm business on 490 dairy farms. Part II consists of an analysis of some of the factors affecting incomes and an examination of the relationship between these factors and labor incomes. Part III is a compilation of supplementary data gathered from the farm business records in the 38 counties. Part IV provides a place for farmers to summarize the business analysis, review their goals and objectives, and do some budgeting for the future.

HOW DO YOU MEASURE UP AS A MANAGER?

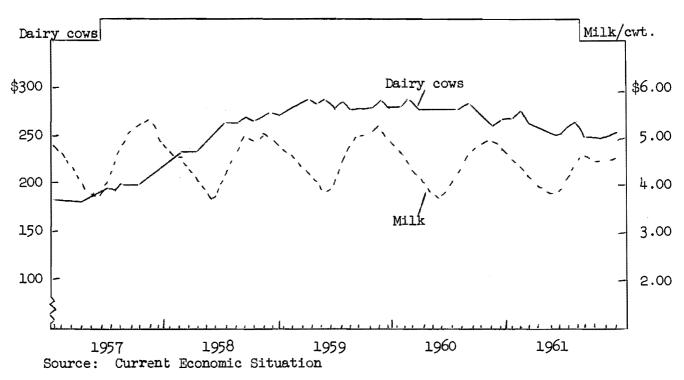

- 1. Have you developed a
 "management procedure"?
- 2. Do you have the economic facts needed for making management decisions?

Steps in making a management decision:

- 1. Locate the trouble spot (problem)
- 2. Review your objective (goal)
- 3. Size up what you have to work with (resources)
- 4. Look for various ways to solve the problem (alternatives)
- 5. Consider probable results of each way (consequences)
- 6. Compare the expected results (evaluate)
- 7. Select way best suited to your situation (decision)
- 8. Put the decision into operation (action)

Good decisions are the crux of sound management!

Prices are one of several important factors affecting farm incomes. When studying farm incomes for any period, we must consider the price situation. This includes both prices received and prices paid. The general level of farm incomes is determined by the relationship of prices received and prices paid by farmers.

The blended farm price for milk in 1961 averaged \$4.30 which was 13¢ below the average for 1960 and 28¢ below 1959. The 1961 milk price was 13¢ below the average price for the ten-year period 1951-60. Dairy cow prices which started to weaken the latter part of 1960 continued to drift downward in 1961. The average price per head in 1961 was down about \$25 from 1959. The index of prices paid by dairy farmers, which had increased each year since 1954, remained stable in 1961.

AVERAGE YEARLY PRICES RECEIVED AND PAID BY N.Y. FARMERS, 1952-61

Year	Milk (cwt.)	Dairy cows (head)	Prices paid by N.Y. dairy farms (1910-14=100)	Year	Milk (cwt.)	Dairy cows (head)	Prices paid by N.Y. dairy farms (1910-14=100)
1952	\$4.76	\$300	350	1957	\$4.58	\$196	363
1953	4.34	209	346	1958	4.55	255	376
1954	4.11	176	343	1959	4.58	284	387
1955	4.09	174	346	1960	4.43	278	394
1956	4.20	180	352	1961	4.30	260	394

PART I SUMMARY OF THE FARM BUSINESS

RESOURCES

The 490 dairy farms included in this summary (farms on which dairy was the only major source of income) were scattered throughout the 24 counties. There was considerable variation in the size and combination of crop enterprises on these farms. The "resources" or things to work with are reported below:

THINGS TO WORK WITH 490 New York Dairy Farms, 1961

	Number		Ran	
Item	reporting	Average*	Low	High
Labor: Man equivalent (No. men) Operator only Hired man 12 or more months Hired help part of year Unpaid family labor Partnerships	(26 farms) (90 farms) (306 farms) (269 farms) (47 farms)	1.8	1.0	7.5
Livestock: (Number) Cows		38	12	183
Heifers		23	0	128
Hens	(29 farms)	60	15	165
Crops: (acres grown) Hay	(485 farms)	66	5	233
Grass silage	(138 farms)	17	1	72
Corn for silage	(369 farms)	15	1	83
Cern for grain	(124 farms)	10	l	38
Oats	(278 farms)	17	ı	55
Total acres in crops		99	10	460

^{*}Average for farms reporting

These were "family farms." The farm operator and members of the family made up most of the labor force.

Crops and livestock other than those listed above were grown on a few of the farms. Only the most common are shown above.

CAPITAL INVESTMENT

"It takes money to make money in a farm business." This money we call "capital investment." In this report, the farm inventory at the end of the year is used as a measure of capital investment.

FARM INVENTORY VALUES, JANUARY 1, 1962 490 New York Dairy Farms

	Amount per farm		Amount per cow		COW	
Item	Average per farm	Your farm		erage farm		Your farm
Machinery and equipment	\$11,062	\$	\$	291	\$	
Cattle	14,263			375		
Feed and supplies, other	3,961			104	_	
Land and buildings	25,827		4	680	****	
TOTAL INVESTMENT	\$55,113	\$	\$1	, 450	\$	

Total investment on these dairy farms averaged about \$55,000 per farm. The average investment per man on these farms was \$30,618. This is about double the capital investment per worker in many industries.

The total investment per cow on these farms averaged \$1,450. Land and buildings amounted to 47 percent, cattle 26 percent, and machinery 20 percent of the total investment.

High capital investment per "productive unit" (per cow) in a business tends to cause a heavier overhead cost per unit. In some cases, it may indicate that the capital resources are not being used to capacity.

The land and buildings investment per crop acre on these farms averaged \$261. On dairy farms, the buildings are a big factor affecting the total value of a farm. It is important, however, that there be sufficient cropland to provide roughage for the cattle kept.

Capital turnover (years required for receipts to equal capital) is sometimes used to measure efficiency in the use of capital. On these farms, it would require 2.4 years for the 1961 farm receipts to equal the capital investment.

WHERE THE MONEY CAME FROM

Every business needs a good source of income. Below we examine the sources of income for these 490 farms in 1961. Total farm receipts averaged \$62 per day.

FARM RECEIPTS 490 New York Dairy Farms, 1961

Item	Your farm	Average per farm	Percent of total
Milk sales	\$	\$16,928	86
Livestock & poultry sold	and the supplementary of the s	1,771	9
Eggs sold	Application of the second of t	18	
Crop sales	Weeping and Street Control of the Association of the Control of th	197	1
Miscellaneous*	-	809	4
Total cash receipts	\$	\$19,723	100
Increase in inventory		2,782	
TOTAL FARM RECEIPTS	\$	\$22,505	

^{*}Includes work off farm, conservation payments, refunds, etc.

Total cash receipts amounted to \$19,723 per farm. Milk was the largest source of income, and made up 86 percent of the cash receipts. Livestock sales amounted to 9 percent of cash receipts.

Increases in inventory are due to gradual expansion and are a usual occurence in a "going" dairy farm business. Inventory changes occur as a result of more cows, larger investment in machinery and equipment, additions to buildings, or a better feed situation. Changes in these items resulted in net increases in inventories of \$2,782 per farm.

Increases in inventory due to expansion are considered as farm receipts. These items could have been sold and turned into cash receipts if a farmer wished to do so. Instead the farmer decided to invest this in his business. In other businesses, they refer to it as being "plowed back."

	Average of 490 farms	Your farm
Average price per hundredweight of 3.7 milk	\$ 4.47	\$
Average milk sales per cow	\$ 445	\$
Average farm receipts per man	\$12,503	\$

WHERE THE MONEY WENT

FINANCIAL SUMMARY OF YEAR'S BUSINESS

There are several ways of measuring the returns from a farm business. These measures have been developed for specific purposes. The measure selected at any one time will depend on the purpose for which it is to be used.

Four measures have been calculated for the 490 dairy farms for 1961. They are: (1) net cash operating income, (2) labor income, (3) cost of producing a hundredweight of milk, and (4) rate of return on investment.

NET CASH OPERATING INCOME 490 New York Dairy Farms, 1961

Item	Your farm	Average per farm
Total Cash Receipts	\$	\$19,723
Total Cash Operating Expenses		11,954
NET CASH OPERATING INCOME	\$	\$7,769

"Net cash operating income" reflects the cash available from the year's operation of the farm business for family living, payments on interest and principal of debts, new capital purchases, and savings. In instances where non-farm income was earned by some member of the family or where money was borrowed or inherited, the cash actually used might be greater than the amount of the cash operating income.

Family living expenses have a first claim on cash income. Fixed debt obligations also have a high priority on available cash.

The size of the cash operating income often determines how a farm family "feels" about their financial situation. If the cash position is short, the family is likely to feel the business is not doing well. It may not be providing a large cash income, but if the business is expanding it may be quite successful in spite of a low cash operating income.

Net cash operating income is $\underline{\text{not}}$ a good measure of the success of the operation of the farm business.

LABOR INCOME 490 New York Dairy Farms, 1961

Item	Your farm	Average per farm
Total Farm Receipts	\$	\$22,505
Total Farm Expenses	\$	\$16,125
Farm Income	\$	\$ 6,380
Interest on average Capital of \$53,722 at 5%	\$	\$ 2,686
LABOR INCOME per farm	\$	\$ 3,694
Number of operators on 490 farms	·	540
LABOR INCOME per operator	\$	\$ 3,352

"Labor Income" is a measure used to determine the return the farm operator receives for his labor and management. It is the amount left after paying all farm expenses, and deducting a charge for unpaid family labor and for interest on the capital invested. Labor income is the measure used most commonly when studying or comparing farm businesses.

Changes in inventories during the year are included in figuring labor income. Increases in inventories due to expanding the business are considered as farm receipts and decreases in inventories are included as farm expenses.

Interest payments and payments on debts are not included in the farm expenses. Tomake all farms comparable, a five percent interest charge on the average capital investment (average of beginning and end inventories) is deducted to get labor income.

The average labor income per operator was \$3,352 or \$279 per month. The labor incomes ranged from minus \$10,500 to \$16,500, or a difference of \$27,000. The distribution of the labor incomes is shown below.

Labor income per operator	No. of farms	Percent
\$5,000 and over	122	25
\$2,500 to \$4,999	180	37
0 to \$2,499	153	31
Minus return	35	7

COST OF PRODUCING MILK 490 New York Dairy Farms, 1961

Item	Your farm	Average per farm
Total Farm Expenses	\$	\$16,125
Interest on Investment		2,686
Value of Operators' Labor* Total	\$	<u>3,967</u> \$22,778
Less: All receipts other the Livestock sales Egg sales Crop sales Miscellaneous Increase in Inventory Total	s	\$ 1,771 18 197 809 \$ 5,577
Net cost of producing milk	\$	\$17,201
Hundredweight of milk sold	distribution and a second	3,787
Cost per cwt. of milk sold	\$	<u> </u>

^{* \$3,600} per year. Some farms had more than one operator.

The cost of producing milk can be calculated by combining total farm expenses, five percent interest on investment and the value of the operator's labor and deducting from this the total of all receipts other than milk. This figure is then divided by the hundredweight of milk sold to determine the cost per hundredweight.

This method assumes that no profit or loss was made on receipts other than milk. That is, the cost of producing these receipts was exactly the same as the price at which they were sold or entered in the inventory. On farms such as these specialized dairy farms, this assumption is not improper.

It should be noted that if the value of the operator's labor was entered at the average labor income, the cost of producing a hundredweight of milk would be equal to the price received. If the operator's labor is entered at a rate higher than the labor income, the cost is more than the price received.

RATE OF RETURN ON INVESTMENT 490 New York Dairy Farms, 1961

, , , , , , , , , , , , , , , , , , , 		
Item	Your farm	Average per farm
Total Farm Receipts	\$	\$22,505
Total Farm Expenses	\$	\$16,125
Farm Income	\$	\$ 6,380
Value Operator's Labor *	\$	<u>\$ 3,967</u>
Return on Investment of \$53,722	\$	\$ 2,413
Rate of Return on Investment	%	4.5%

^{* \$3,600} per year. There were 540 operators on 490 farms.

The return on investment is calculated by deducting from the "Farm Income" a charge for the operator's labor. This return is then divided by the average investment for the year to determine the rate of return on investment.

The average return on investment was 4.5 percent or slightly more than the rate of interest many people earn on their savings.

PART II - ANALYSIS OF THE FARM BUSINESS

It is important that farmers learn how to keep good recrods and continue to keep these records to check on the financial success of their businesses. It is much more important that farmers use these records to analyze the farm business to determine the strong and weak points and use this analysis as a basis for making changes in the business. This section of the publication presents averages for various business factors with which farmers can compare their own businesses. Feed costs and labor and machinery costs are studied in detail. Also included are some tables and graphs to show the relationship of some of the business factors to labor incomes.

The relationship of size of business, rates of production, labor efficiency, and cost control to labor income is examined. The measures used for each of these factors are:

Size of business:

Number of cows

Rates of production: Labor efficiency: Pounds of milk sold per cow Pounds of milk sold per man

Cost control:

Percent purchased feed is of milk receipts

Machinery cost per cow

Labor and machinery cost per cow

Complete asset and liability information for a group of 74 farms from five counties is included to help farmers do some analysis of their own financial situation.

LABOR AND MACHINERY COSTS

Machinery costs exceed feed costs on some dairy farms. They are important on every dairy farm and are becoming more important each year.

MACHINERY COSTS*
490 New York Dairy Farms, 1961

T.		Average per f	
Item	Your farm	Amount Pe	r cent
Beginning inventory \$		\$10,442	
New machinery bought	-	2,065	
Total	\$	\$12,507	
End inventory \$		\$11,062	,
Machinery sold		51	
Total	\$	<u>\$11,113</u>	
Depreciation	\$	\$ 1,394	34
Interest @ 5% Av. inventor		538	13
Gas and oil		703	17
Machinery repairs		799	20
Milk hauling	***************************************	353	9
Machine hire		104	3
Auto expense (farm share)	***************************************	<u>165</u>	4
Total machinery cost	\$	\$ 4,056	100
Machinery cost per cow	\$	\$ 107	
Machinery cost per cwt. milk sol	.d	\$ 1.07	
Machinery cost per crop acre		\$ 41	
Machinery cost per man	-	\$ 2,253	

^{*}Does not include insurance, housing, or farm labor on repairs.

With machinery costs per cow of \$107 and an average milk price of \$4.47, it would take almost 2,400 pounds of milk to pay the machinery costs for each cow. These costs can make or break a dairyman.

LABOR AND MACHINERY COST 490 New York Dairy Farms, 1961

Item	Your farm	Average per farm
Labor costs:		
Value operators' labor*	\$	\$ 3, 967
Hired labor	\$	1,319
Unpaid family labor	-	373
Total labor	\$	\$5,659
Machinery cost:		
Total machinery cost		4,056
Total labor and machinery cost	\$	\$9,715
Labor and machinery cost:		
Per crop acre	\$	\$ 98
Per cow	\$	256
Per cwt. milk sold	\$	2.57

^{*}Operator's labor valued at \$3,600 per year. There were 540 operators on the 490 farms.

Farmers frequently justify high machinery costs on the basis that the machinery has saved labor. To check on this, one can figure the combined labor and machinery cost per unit.

Since the operator is not paid, it is necessary to estimate the value of his labor. Here the operator's labor has been valued at \$3,600 per year. This gives some basis for studying the total labor and machinery costs on a farm.

The total cost of labor to a farm business is many times overlooked. The operator and his family supply about two-thirds of the labor on the average of these dairy farms. Much of this labor cost doesn't show in a farm record because it is not paid directly. With the operator's labor valued at \$300 per month, the total labor cost was 40 percent greater than the machinery cost.

Of the total cost of producing milk, labor made up 25 percent while feed was 21 percent, machinery cost 18 percent and all other costs 36 percent. Labor becomes the largest single cost in the operation of a dairy farm when the value of the operator's labor is included. It is highly important that all farm labor be used efficiently.

FEED COSTS

Feed bought is the largest single expense item on most dairy farms. It is good management to keep watch of this cost item. Below are some "checks" which may help in locating weaknesses in the feed program.

SELECTED FACTORS RELATED TO FEED COSTS 490 New York Dairy Farms, 1961

Item	Your farm		Ave	erage	per	farm
Purchased Feed Dairy feed bought (grain and hay)	\$				\$1	,742
Feed bought per cow	\$	····			\$	125
Feed bought as % of milk receipts		%				28%
Feed bought per cwt. of milk sold	\$				\$	1.25
Roughage Harvested (hay equivalent) Hay (tons)			169	tons		
Corn silage (tons : 3)			45	tons		
Grass and other silage (tons : 3)			18	tons		
Total tons hay equivalent	Booth				232	2 tons
Tons hay equivalent per cow					6.3	L tons
Other Considerations Total acres in crops per cow					2.6	s acres
Lime and fertilizer expense per crop a	.cre \$				\$7	.04
Lime and fertilizer expense per cow	\$				\$	18
Number of heifers per 10 cows					6	5.1

roughage is used for both the heifers and cows. This measure of hay equivalent is of quantity only. Quality is also important. To have high quality hay, haying should be started by June 1st and be finished before July 1st. Time

What was the "quality" of your hay in 1961?

of cutting influences the quality of hay more than any other factor.

When did you finish your first cutting?

IMPORTANT FACTORS AFFECTING FARM INCOMES

Research has shown that size of business, rates of production, and labor efficiency are three important factors affecting farm incomes. Below are the group averages of selected measures for each of these three factors.

BUSINESS FACTORS 490 New York Dairy Farms, 1961

Factor	Your farm	Average per farm
Size of Business		
Total work units	**************************************	516
Man equivalent	Apple of the State	1.8
Number of cows		38
Pounds of 3.7 milk sold	·	378,684
Rates of Production Pounds of 3.7 milk sold per cow	-	9,965
Tons of hay per acre	-	2.6
Tons of corn silage per acre		12
Bushels of oats per acre		50
abor Efficiency Work units per man		28 7
work units per man		201
Number of cows per man	**************************************	21
Pounds of 3.7 milk sold per man		210,380
Crop acres per man		55

Farm management studies show that, in general, larger farms pay better than smaller farms. Larger farms make it possible to make better use of labor and equipment. However, size alone does not always mean profitable operation.

High rates of production are obtained by following the best known practices in both crop and animal production.

Good labor efficiency can be accomplished in many ways. Some farmers do it by long hours of work. Others get efficiency by wise use of labor saving equipment. Still others develop efficient work habits and practices.

COST CONTROL

Expenditures on a modern dairy farm are large. These 490 dairy farms in 1961 spent an average of \$1,343 per month, or about \$44 per day. The way this money is spent has an important effect on the operator's income.

"Cost control" is essential in any business. This means keeping check on all costs. One can spend "too little" as well as "too much." In trying to keep costs down, a farmer must guard against cutting costs which reduce the efficiency of the business.

Below are some "yardsticks" for checking the reasonableness of expenses on a dairy farm.

COST CONTROL MEASURES
490 New York Dairy Farms, 1961

Item	Your farm	Average per farm
% Feed bought is of milk receipts	%	28%
Feed bought per cow	\$	\$ 125
Fertilizer & lime cost per cow	\$	\$ 18
Machinery repairs per cow	\$	\$ 21
Taxes and insurance per cow	\$	\$ 21
Electricity and telephone per cow	\$	\$ 9
Total farm expense per cow	\$	\$ 430
Machinery cost per crop acre	\$	\$ 41
Fertilizer & lime per crop acre	\$	\$7.04
Gas & oil per crop acre	\$	\$7.10
Taxes and insurance per crop acre	\$	\$8.10
Expenses are of receipts	<u></u>	72%

There is ${\hbox{NO}}$ magic for keeping costs in line. All cost items must be watched. Little "extra" costs add up over time.

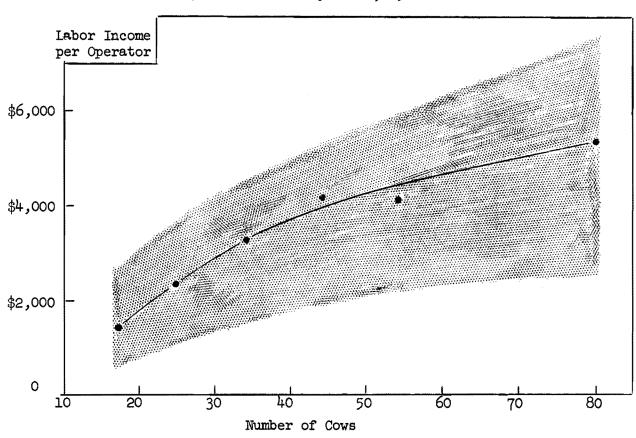

FARM BUSINESS CHART FOR FARM MANAGEMENT COOPERATORS

In 1961, a total of 490 farms were included in the general dairy farm business summary. Business analysis of these farms show them to be above the state average in most factors affecting profits. Information from these farms has been used to construct the chart below. The figure at the top of each column is the average for the highest (or lowest) ten percent of the farms in that factor. The next figure in the column is for the next highest ten percent of the farms and so forth down the column. Each of the columns is independent of the others.

	Size		Rates	of Pro	duction	Labor E	ficiency	Feed F	actors
Man equiv- alent	Number of cows	Pounds of milk sold	Pounds milk sold per cow	Tons hay per acre	Tons corn silage per acre	Cows per man	Pounds milk sold per man	Hay equiv. per cow	Percent feed is of milk receipts
3.3	75	802,800	12,900	4.2	20	32	337,800	10.3	12
2.4	52	540,700	11,700	3.4	16	26	273,100	8.0	18
2.2	45	454,600	11,100	3.0	15	25	248,500	7.1	21
2.0	39	400,000	10,600	2.8	13	22	229,700	6.5	24
1.8	36	361,300	10,200	2,5	12	21	208,700	6.1	27

How does your business measure up against this group of commercial dairy farms? Take a pencil and draw a line through each column which will show where your business stands. Are you in the "first division" (above the center line) on more than half of these factors?

COWS PER FARM AND LABOR INCOME 490 New York Dairy Farms, 1961

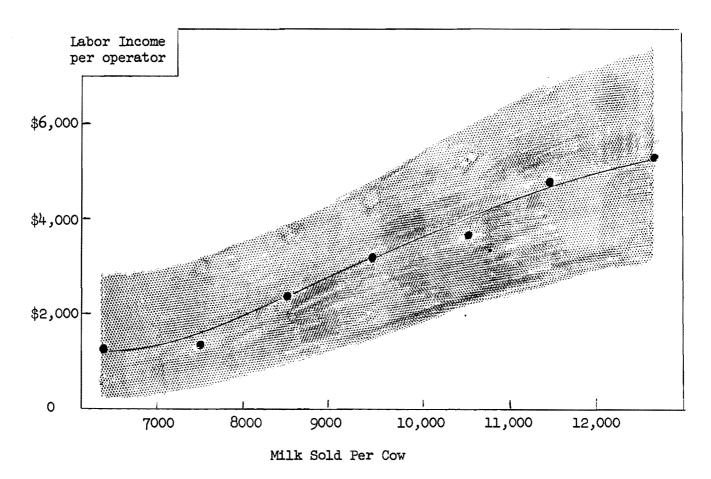

The dots on the above graph represent the average labor income for each of the groups in the table below. The solid line on the graph shows the tendency for labor incomes to be higher as the size of the herd increases. The shaded area on the above graph (and those on the next five pages) represents the labor incomes of approximately the middle half of the farmers in each herd size group. One-fourth of the labor incomes are below and another one-fourth are above the shaded area. The variation in labor incomes is greater as the size of herd increases. In general, the larger farms had higher labor incomes, but it can be seen from the graph that some farmers with 25 cows had higher labor incomes than other farmers with 80 cows.

COWS PER FARM AND LABOR INCOME 490 New York Dairy Farms, 1961

MILK SOLD PER COW AND LABOR INCOME 490 New York Dairy Farms, 1961

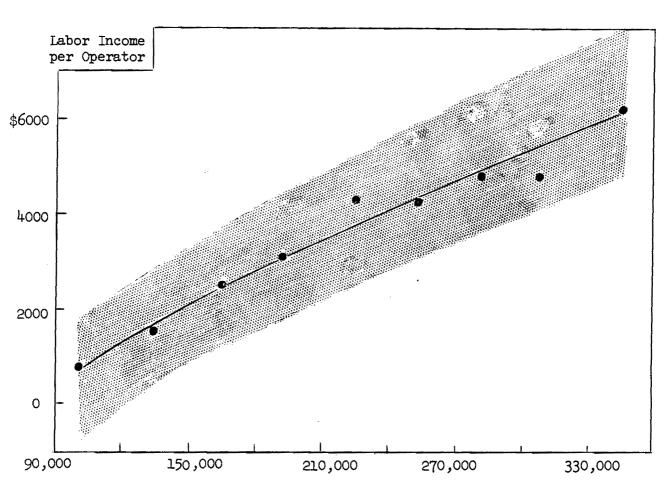

The average income per operator was over four times as great on the farms that sold over 12,000 pounds of milk per cow as on those that sold less than 7,000 pounds. The shaded area shows that there is somewhat more variation in labor income among farms as the milk sold per cow increases. The farms with higher producing cows had slightly larger herds and sold more milk per man.

POUNDS OF MILK SOLD PER MAN AND LABOR INCOME 490 New York Dairy Farms 1961

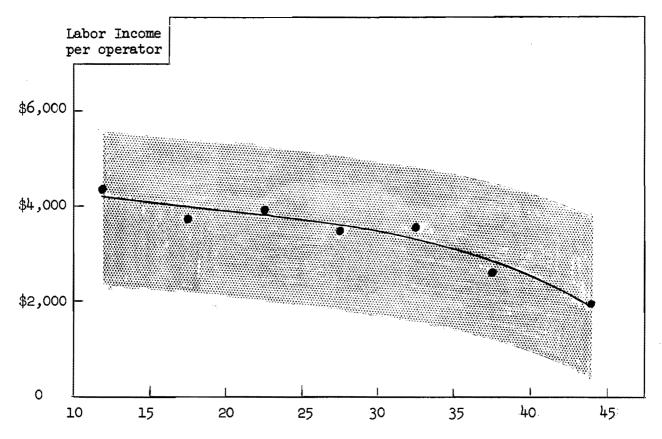

Pounds of Milk Sold per Man

Average labor income increased rapidly as milk sold per man increased. Man equivalent per farm remained relatively constant while the average number of cows and milk sold per cow increased markedly. On the farms that sold more milk per man, each man handled more cows and each cow produced more milk than on the farms with low milk sold per man.

PERCENT PURCHASED FEED IS OF MILK RECEIPTS AND LABOR INCOME 490 New York Dairy Farms, 1961

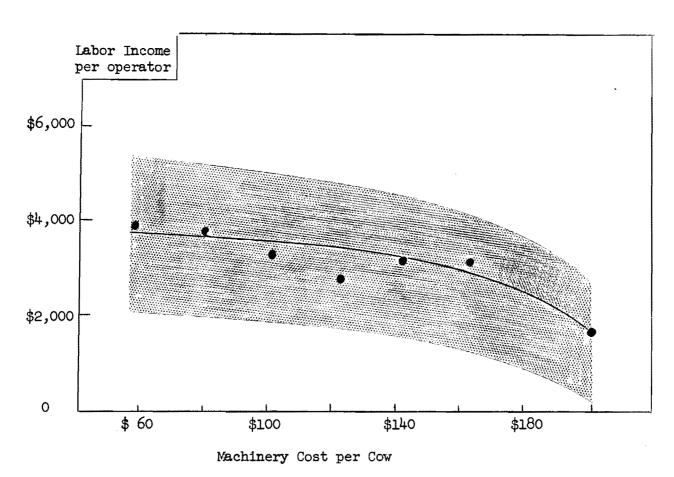

Percent Purchased Feed is of Milk Receipts

The farmers that paid out 35 percent or more of their milk receipts for purchased feed had considerably lower labor incomes than those that paid out a smaller percentage. There was little difference in labor incomes in the 15 to 35 percent range but farmers that paid out less than 15 percent of the milk check for feed had somewhat higher incomes.

PERCENT PURCHASED FEED IS OF MILK RECEIPTS AND LABOR INCOME 490 New York Dairy Farms, 1961

MACHINERY COST PER COW AND LABOR INCOME 490 New York Dairy Farms, 1961

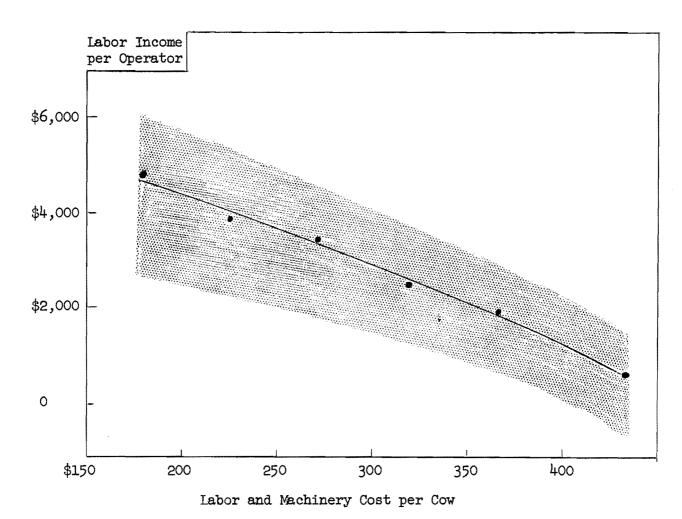

Labor incomes were lower on farms with machinery costs per cow of over \$180 than on the farms with lower costs. Milk sold per man was about the same for all groups while milk sold per cow was somewhat higher on the farms with high machinery costs per cow. The farms with higher machinery costs per cow had smaller herds.

LABOR AND MACHINERY COST PER COW AND LABOR INCOME 490 New York Dairy Farms, 1961

The average labor income was much higher on farms with labor and machinery costs under \$200 than on those with costs of \$400 or more per cow. Average herd size and pounds of milk sold per man were greater on farms with low labor and machinery cost per cow. Milk sold per cow was slightly higher on farms with higher labor and machinery costs.

COMBINATION OF FACTORS

In this section, four major factors were studied in combination. The factors used were size, rates of production, labor efficiency and cost control measured by number of cows, pounds of milk sold per cow, pounds of milk sold per man, and percent that purchased feed was of milk receipts, respectively. For each factor, the farms were divided on the basis of whether they were above or below the average for the 490 farms.

Sorting the farms in this manner, the number of farms and the average labor incomes are reported for sixteen different combinations. There were 39 farms that were high in all four factors, and 65 farms that were low in all four factors. The group that was high in all factors had an average labor income of \$6,660, whereas the group that was low in all four factors had an average labor income of \$1,070.

COMBINATION OF FACTORS ABOVE AVERAGE AND LABOR INCOME 490 New York Dairy Farms, 1961

n	Farms with more than 38 cows			with ess cows	
	umber of .rms	Labor income per operator	Number of farms	Iabor income per operator	
Pounds milk sold/cow above av. Pounds milk/man above av. Feed is of milk av. & below* Feed is of milk above av.	÷ 39	\$6,660	35	\$4,980	
	39	5,140	41	3,830	
Pounds milk/man av. & below % Feed is of milk av. & below* % Feed is of milk above av.	12	4,520	40	3,190	
	7	3,470	22	2,530

	16	1,640	65	1,070	

^{*} In a farm business, it is preferable that the percent that purchased feed is of the milk check be below average.

COMBINATION OF FACTORS ABOVE AVERAGE* AND LABOR INCOME 490 New York Dairy Farms, 1961

Number of factors better than average	Number of farms	Labor income per operator
4 factors better than average	39	\$6,660
3 factors better than average	96	4,970
2 factors better than average	155	3,420
1 factor better than average	135	2,350
O factors better than average	65	1,070

* Factors were: size as measured by number of cows
rate of production as measured by pounds milk sold per cow
labor efficiency as measured by pounds milk sold per man
cost control as measured by percent purchased feed was of milk
receipts.

The farms were further grouped on the basis of the number of factors better than the group average. As the number of factors which were better than average decreased, the average labor income decreased rapidly.

The farms that were better than average in size of business, rates of production, labor efficiency and cost control made high labor incomes. Farms that were better than average in three of the four factors made very acceptable labor incomes.

Farmers who were below average in all factors or above average in only one factor made rather low labor incomes. If a farmer wants to achieve a high labor income, he needs to be above average in at least three of the factors. This may seem difficult to some, but 28 percent of the farmers in this study achieved this goal in 1961.

NET WORTH STATEMENT, 74 FARMS

In studying a farm business, it is apparent that the common measures used to analyze the business do not always bring out all the problems. Many times it is the debt load that keeps a farm business from supplying the family with sufficient money for family living. This can come about in at least two ways. One may be that even though the business is profitable, a heavy debt load with too short a repayment period takes so much of the profits that little is left for the family. Another possibility is that solving problems in a farm business may be very difficult because the present debt committments may make it nearly impossible for the operator to borrow money needed to make improvements in the business.

Many times an analysis of an individual farm business necessarily leads into the credit situation of the operator. Included in this summary is asset and liability information from 74 farms in five counties. These farmers reported assets and liabilities on a voluntary basis. No farm was included unless the operator had some debts.

Total debt per cow	\$		\$626	\$398		

The blank spaces on the previous page will help a farmer to determine his net worth and the averages will help him look at his debt load in comparison to the debts of other farmers. These averages are not representative of all the farms in the farm business management projects. The debt load on these farms is believed to be heavier than on the average farm in the groups.

The 43 farms in Cayuga, Madison and Schoharie Counties had over 90 percent of their total assets invested in the farm business. Farmers usually have most of their assets tied up in the farm business. On the 43 farms, a little less than half of the farm assets was invested in land and buildings and slightly more than half in cattle, equipment, feed and supplies.

Fifty-seven percent of the liabilities on these farms were in the form of mortgage or long term credit and 43 percent in short term obligations. The average herd size on these farms was 40 cows. The mortgage debt was \$358 and the short term debt \$268 per cow, making a total debt of \$626 per cow. This is a more favorable balance between long and short term debt than on many farms. Many operators have more short term than long term debts. This tends to make heavy repayment schedules that may be difficult to meet.

Farmers in both the Cayuga, Madison, Schoharie and the Jefferson and St. Lawrence groups had about two-thirds equity in their businesses. In other words, they were about one-third in debt. On the average, these farmers' debt loads are not excessive when compared to assets. However there are tremendous variations among the farmers. Some had almost 100 percent equity in their businesses, while others had almost no equity.

Farmers cooperating in the business management projects have not been requested to submit complete asset and liability information as a formal part of the program. Much individual work has been done with these farmers relative to their financial structure and debt situation. Complete asset and liability information from a larger number of farmers would be useful in analyzing farm businesses.

PART III - SUPPLEMENTARY INFORMATION

This section consists of statistics for many different groups of farms that will be useful for teaching purposes.

Included are averages for each of the following:

Farms with major sources of income other than milk Rented dairy farms
Farms with large amounts of off-farm work
Farms sorted by herd size
Thirty high and 30 low labor income farms
Participating farms in each county
Comparison for years 1957-61

The county figures include farms with major sources of income other than milk.

^{*} The averages for 1960 and 1961 include only farms with milk as the major source of income as described on page 1. The 1957-59 averages include some farms with large sources of income other than milk.

^{**}Average per farm reporting.

^{***}Changes in work units for some crops and livestock made in 1958 and 1960.

PART IV SUMMARY OF THE ANALYSIS; GOALS, AND BUDGETING

SUMMARIZING THE ANALYSIS

Each page in this booklet was designed to help you study your farm business. However, study and analysis alone will not assure a more profitable business. Action must be taken.

Now take a careful overall look at your farm business. Summarize the strong and weak points revealed from the detailed analysis. This will help you to locate the trouble spots or problems. In view of what you have to work with, consider the possible ways that these problems might be solved. Next budget the likely effects of the proposed changes. Finally decide on the most promising proposal and then take action to put it into effect.

	٠,	

WHAT ARE YOU WORKING FOR?

The discussions in this report have centered around ways to make more money from your business. But you don't operate your business just for the sake of keeping busy. Every family has some things uppermost in their minds that they expect to get from their business or their job. These "objectives" or "goals" may not be easy to put into words. But if they are written down, or at least talked about, it may help you see what things need to be done in the farm business in order to accomplish these goals.

Goals for Your Farm and Family

The :	Farm List the major farm improvements you want to make in the next five years. The list should include changes in buildings, land, crops, and livestock.
The l	Home List major changes you want to make in the home in the next five years. Include remodeling, equipment, and furniture.
Fami	ly Security List things you want to get done relative to financial security. This list might include debt reduction, a better life insurance program, more business insurance, a will, plans for retirement.
Educ	ation List your objectives for educating the children.
Recr	eation List your plans for major vacations, trips, new cars, etc.
Bette	er Working Conditions What do you hope to accomplish concerning the hours you work, lightening physical work, and the like?
The (Community What do you hope to get done relative to making your community a better place to live - schools, church, roads, and so forth?

BUDGETING A CHANGE IN YOUR FARM BUSINESS

After locating the weak points in a business, the next step is to consider changes to correct the weaknesses. Budgeting can help to determine the likely results of a proposed change.
