Putnam and Richard Overton, Extension Support Specialists, in the Dyson School of Applied Economics and Management at Cornell University; Jason Karszes, Senior Extension Associate, Pro-Dairy, Department of Animal Science at Cornell University; and Cathryn Dymond, work-study student.

ABSTRACT

Business and financial records for 2010 from 204 New York dairy farm businesses are summarized and analyzed. This analysis uses cash accounting with accrual adjustments to measure farm profitability, financial performance, and costs of producing milk. Traditional methods of analyzing dairy farm businesses are combined with evaluation techniques that show the relationship between good management performance and financial success.

The farms in the project averaged 489 cows per farm and 24,508 pounds of milk sold per cow, which represent above average size and management level for New York dairy farms. The New York Agricultural Statistics Service reports 20,807 pounds milk production per cow for New York. An average New York herd size per farm of 120 is estimated in Appendix Table A3, page 85.

Net farm income excluding appreciation, which is the return to the operator's labor, management, capital, and other unpaid family labor, averaged \$326,482 per farm. The rate of return to all capital invested in the farm business including appreciation averaged 8.5 percent.

Differences in profitability between farms continue to widen. Average net farm income excluding appreciation of the top 10 percent of farms was \$1,585,864, while the lowest 10 percent was -\$78,221. Rates of return on equity with appreciation ranged from positive 31 percent to negative 42 percent for the highest decile and the lowest decile of farms, respectively.

Large freestall farms averaged the highest milk output per cow and per worker, the lowest total cost of production and investment per cow. In 2010 they averaged the highest returns to labor, management and capital. Farms milking three times a day (3X) were larger, produced more milk per cow and had higher net farm incomes in 2010 than herds milking two times per day (2X). Operating costs per hundredweight of milk were \$0.08 per hundredweight lower for 3X than 2X milking herds, while output per cow was 5,239 pounds higher.

Farms adopting intensive grazing generally produced less milk per cow than non-grazing farms but averaged higher labor and management incomes per operator. One should not conclude that adoption of these technologies alone were responsible for differences in performance.

INTRODUCTION

Dairy farm business summary (DFBS) projects are an integral part of Cornell Cooperative Extension's agricultural educational program in New York State. The Charles H. Dyson School of Applied Economics and Management of the College of Agriculture and Life Sciences at Cornell University, and County and Regional Extension staff, cooperate in sponsoring DFBS projects. In 2010, over 320 dairy farms participated, including dairy owners, renters, full-time, part-time, and out-of-state farms. Business records submitted by dairy farmers from 46 New York counties provide the basis for continuing Extension programs, data for applied studies, and for use in the classroom. Regardless of the use of the data, confidentiality of individual farm data is maintained.

Cornell Cooperative Extension educators enroll the cooperators and collect the records. In addition, assistance is provided by individual consultants Bruce Dehm and Charles Radick; Cathy Wickswat from Cargill Animal Nutrition; and by consultants from Farm Credit East Association. Each cooperator receives a detailed summary and analysis of his or her business. All educators are using a computer in their offices or on the farm to process and return the individual farm business reports for immediate use. The program used to generate the farm business reports can be found at the website <http://dfbs.cornell.edu>. Regional reports are prepared by Cornell faculty and used by DFBS cooperators and other farmers to compare their farm performance with regional averages.

The DFBS program helps farmers improve accounting and financial analysis techniques, develop managerial skills, solve business and financial management problems and plan the future of their business. For more information, please visit <http://dfbs.aem.cornell.edu>

Individual farm records from the three regions and 46 counties of the State (Figure 1, page 2) have been combined and the total data set analyzed to determine the effects of different levels of price, technology, and management on dairy farm incomes. This study provides current dairy farm business information for use by farmers, Cooperative Extension staff, teachers, and others concerned with the New York dairy industry.

Trend Analysis

Farms in New York have changed dramatically over the past 50 years. Farms are larger, more efficient with greater rates of production and generally more profitable. Changes have also occurred in recent years especially in regard to costs and milk price (see pages 3-7).

Farms Included

Data from 204 specialized dairy farms are included in the main body of this report starting on page 8. These farms do NOT represent the "average" for all dairy farms in the State. Participation was on a voluntary basis, therefore, not all areas or types of operations were proportionately represented (Figure 1, page 2). All New York DFBS participants (nearly 280) represent more than five percent of the milk cow operations in New York (see Appendix Table A3). The 204 specialized dairy farms represent a cross section of better than average commercial dairy farm owner/operators in the State. The DFBS participating farms represent 19 percent of the total New York milk production and 16 percent of the total cows in the State. Dairy farm renters, dairy-cash crop farmers with crop sales exceeding 10 percent of milk sales, part-time dairy operators, and organic farms are not included in the main body of this report. Data on dairy farm renters are summarized separately in the supplemental information section of the publication.

Features

Accrual adjustment procedures have been used to provide the most accurate accounting of farm receipts and farm expenses for measuring farm profits. An explanation of these procedures is found on page 9. Five measures of farm profitability: net farm income, labor and management income, return on equity, return on all capital, and return to all labor and management are calculated on pages 11 through 14. The balance sheet is presented with the current portion of intermediate and long-term debt identified as a current liability, on pages 14 and 15. The statement of owner equity, which shows the interrelationship between farm profitability, non-farm cash flows and net worth is presented on page 17. A detailed cash flow statement, as well as budgeting data and debt repayment analysis are presented on pages 18 through 20.

The whole farm method of calculating the cost of producing milk is detailed on pages 28 through 33. The operating cost, purchased inputs cost and total cost of producing 100 pounds of milk are developed and analyzed. Farm business charts for farms with conventional and freestall housing are presented on pages 66 through 70. Specific studies of the performance of dairy farms using rotational grazing and three times (3X) a day milking are presented on pages 71 and 78.

FIFTY YEARS OF NEW YORK STATE DAIRY FARM BUSINESS DATA

New York dairy farming has changed dramatically over the past 50 years (Table 1, page 4). Dairy cows per farm on cooperating farms increased 14 fold between 1960 and 2010 with nearly a doubling in herd size over the last 10 years. The DFBS sample is not representative of all farms in New York State. Milk output per cow increased 157 percent with the largest increase occurring between 1990 and 2000. Labor efficiency, measured by pounds of milk sold per worker, is up 458 percent on DFBS farms, and the operating cost of producing milk increased more than 620 percent with the largest jump occurring between 1970 and 1980.

There is a large increase in farm capital invested per farm, which is 91 times greater than in 1960. Net farm income per farm increased 788 percent (adjusted for 2010 dollars). Labor and management income per operator is up 314 percent from 50 years ago (adjusted for 2010 dollars). This is a reflection of the increased variability over the last 10 years. Some factors could not be calculated with 1960 and 1970 data because liabilities, interest paid, and/or appreciation were not available in those years. Farm net worth excluding deferred taxes has increased 290 percent over the last 40 years and rate of return on equity capital decreased 3.5 percent since 1980.

FOUR YEARS OF VARIABILITY

Recognition and evaluation of the progress that has occurred on farms can best be achieved by studying the same farms over a period of time. Table 2, page 5, presents average data from 156 farms that were DFBS cooperators each year since 2007. Chart 1 shows the price received for milk in comparison to the operating cost of producing a hundredweight of milk for these farms. The higher milk price and higher costs in 2007 still provided dairy farmers with the highest operating margin per hundredweight of \$6.70.

Average net farm income without appreciation in 2010 was 40 percent below the 2007 average, and 385 percent above the 2009 average. Net worth increased 22 percent in 2007, increased 5 percent in 2008, decreased 8 percent in 2009, and increased 10 percent in 2010.

The last four years have been a period requiring skillful decision making and improved management skills on the part of New York dairy farm operators. Risk management skills, including output price management, are becoming more important to farm business success.

⁶Based on hours actually worked by owner/operator instead of standard 12 months per full-time owner/operator.

ADJUSTING PROFIT, PRICE AND COSTS FOR INFLATION

Labor and management incomes per operator in 2010 were much improved over 2009, when measured in nominal (actual) value (Chart 2). Over the period 1993 to 2009, labor and management incomes per operator did not exceed \$50,000 except for \$55,000 in 1998, over \$78,000 in 2004, nearly \$65,000 in 2005, \$189,019 in 2007, and \$75,945 in 2008. The reader is reminded that the average herd size of DFBS participating farms steadily increased from 130 cows to 489 cows over this period.

Chart 2.

LABOR AND MANAGEMENT INCOMES PER OPERATOR
Dairy Farm Business Summary Farms, 1993-2010

Milk prices in 2010 averaged \$17.81 per hundredweight in actual dollars (Chart 3). However, the 2010 milk price, adjusted for inflation, in 1994 dollars, would have been only \$12.10 per hundredweight.

Operating costs of producing milk (actual) were similar in 1994 and 1995 (Chart 3). Feed costs were higher in 1996 and so were operating costs of producing milk. Operating costs were on a downward trend from 1996 through 2000. Operating costs then increased in 2001, fell in 2002, and increased in 2003 and 2004, but remained higher than the early 1990's. Operating costs decreased slightly in 2005 and 2006 but increased nearly \$2 per hundredweight in 2007 and another \$1.19 in 2008 followed by a \$1.50 decrease in 2009. In 2010, operating costs increased slightly from 2009 to \$13.76 per hundredweight. Real costs of producing milk per hundredweight have been on a downward trend over this 15-year period except for increases in 1996, 2001, 2004, 2007 and 2008.

Chart 3.

OPERATING COST OF PRODUCING MILK AND MILK PRICE⁷
Dairy Farm Business Summary Farms, 1994-2010

⁷ Actual operating cost of producing milk as well as milk price are adjusted for inflation, to obtain real values, using the Consumer Price Index–1994 dollars.

Accounting Procedures

Accrual accounting adjustments are made to cash receipts and expenses to accurately measure annual receipts, expenses, and farm profitability. These procedures express the true value and cost of production for the year, regardless of whether cash was received or expended in this year. Cash expenses and cash receipts are used when evaluating the cash flow position of the business.

The accrual accounting adjustments consider changes in accounts payable and receivable, prepaid expenses, and changes in inventory of not only such items as crops and livestock, but also the inventory of production items such as fertilizer, seed and fuel. In this manner, the total cost of production and the total value of production are obtained to provide an accurate representation of profitability in that year.

Accrual adjustments are complemented by accounting procedures used to separate changes in inventory of capital assets into changes caused by price and those caused by quality or quantity changes. Separating price changes (appreciation) from physical changes in the farm inventory are important in determining farm profitability. Appreciation of farm assets is included in the return to farm capital, but excluded from the return to labor and management.

Income Statement - Expenses

The accrual income statement begins with an accounting of all farm business expenses. Farm business expenditures are grouped into the following nine major categories:

1. Hired labor includes gross wages plus the farm share of social security, workers' compensation insurance, employee health insurance and other employee benefits paid by the farm employer.
2. Feed expenses are divided into purchased dairy grain and concentrate, purchased dairy roughage and all feed purchased for nondairy livestock to allow more thorough analysis of dairy herd feeding costs. The costs of growing grain and roughage are not included in cash and accrual feed expenses.
3. Machinery costs represent all the operating costs of using machinery on the farm. Ownership costs are excluded here but are included in the analysis of machinery costs presented on page 22.
4. Livestock expenses include the cost of supplies and services directly associated with the care and maintenance of the dairy herd, such as breeding, veterinary, bedding, milking supplies and custom boarding expenses plus milk marketing costs. The purchase of replacement cattle is considered a herd maintenance expense while expansion livestock is not.
5. Crop expenses include the costs of fertilizer, lime, seeds, spray and other crop supplies.
6. Real estate expenses are the direct costs associated with owning and maintaining farm land and buildings.
7. Other includes insurance, the farm share of utilities, interest paid on all farm indebtedness and miscellaneous costs.
8. Expansion livestock is purchased dairy cattle and other livestock that cause an increase in herd size from the beginning to the end of the year. It is a nonoperating cost included in total expenses.
9. Depreciation of machinery and buildings are nonoperating costs included in total expenses. Depreciation charges are based on those reported for income tax purposes.

Cash and accrual farm expenses are summarized below. Total operating accrual expenses for the 204 farms averaged \$5,264 per day and 92 percent of total farm accrual expenses. Cash paid is the actual amount of money paid out during the year and does not necessarily represent the cost of goods and services actually used.

Table 4.

CASH AND ACCRUAL FARM EXPENSES
204 New York Dairy Farms, 2010

Expense Item	Cash Paid	-	Change in Inventory or Prepaid Expense	+	Change in Accounts Payable	=	Accrual Expenses	Percent

Machinery depreciation							\$94,106	
Building depreciation							\$63,828	
TOTAL ACCRUAL EXPENSES							\$2,089,940	

Change in inventory represents feeds and supplies purchased this year but not used (positive change), and similar items purchased in a prior year and used this year (negative change). For example, used dairy roughage inventory from a prior year was \$533.

Prepaid expenses (noted by « in Table 4) are advance payments made for services and noninventory items to be used in future years. For example, advance payments for utilities decreased an average of \$91 per farm in 2010, and that decrease is added to cash rent to determine the correct 2010 accrual utilities expense.

Changes in accounts payable reflect supplies/services used in this year's production but not paid for (positive change), and payments for production inputs used in a prior year (negative change).

Accrual expenses are cash expenses adjusted for changes in inventory, prepaid expenses and accounts payable. They are the total costs of inputs actually used in this year's business. Total change in inventory and prepaid expenses equals \$18,172 and total change in accounts payable equals \$-20,349.

Income Statement - Receipts

Cash and accrual farm receipts are presented in the following table. Total cash receipts averaged \$2,299,433 per farm. Total accrual receipts averaged \$2,416,422 per farm. Accrual receipts were greater than cash receipts due to dairy herd and homegrown feed inventory growth. Cow numbers increased an average of 21 head per farm. Homegrown feed inventory per cow increased \$57 from beginning to end of year.

Table 5.

CASH AND ACCRUAL FARM RECEIPTS 204 New York Dairy Farms, 2010

Receipt Item	Cash Receipts	+	Change in Inventory	+	Change in Accounts Receivable	=	Accrual Receipts	Percent
Milk sales	\$2,104,902				\$28,352		\$2,133,253	88

Other	34,642				77		34,720	1
- Nonfarm noncash capital transfer ⁹			(-) 0				(-) 0	
Total	\$2,299,433		\$88,659		\$28,330		\$2,416,422	100

⁸Change in advanced government receipts.

⁹Gifts or inheritances of cattle or crops included in inventory.

Cash receipts include the gross value of milk checks received during the year plus all other payments received for the sale of farm products, services and government programs.

Accrual receipts represent the value of all farm commodities produced and services actually provided by the farmer during the year. Increases in livestock inventory caused by herd growth and/or quality, are included. Decreases in inventory caused by herd reduction are deducted. Changes in inventories of crops grown are included. Changes in advanced government receipts are the amount by which government payments received for participating in a future year's program have changed from 2009 to 2010. An increase requires a negative adjustment to cash receipts while a decrease is a positive adjustment. Changes in accounts receivable include the difference between the January milk check for December 2010 marketings and the previous January's check, and other delayed payments.

Nonfarm noncash capital transfers are gifts and inheritances of cattle and crops received by the farm owner/operator, and included in inventory or used in the business during the year. They are deducted from growth in inventory and reduce accrual receipts because they came from outside the farm business. Gifts and inheritances of machinery and real estate are accounted for in Table 12.

Profitability Analysis

Farm owners/operators contribute labor, management, and capital to their businesses. The best combination of these resources produces optimum profits. Farm profits can be measured as the return to all family resources or as the return to one or more individual resources such as labor and management.

Net farm income is the total combined return to the farm operator(s) and other unpaid family members for their labor, management and equity capital. It is the farm family's net annual return from working, managing, financing and owning the farm business. This is not a measure of cash available from the year's business operation. Cash flow is evaluated later in this report.

Net farm income is computed with and without appreciation. Appreciation represents the change in farm inventory values caused by changes in prices during the year. Appreciation is a major factor contributing to changes in farm net worth and must be included in the profitability analysis. Net appreciation totaled \$87,472 per farm in 2010. On the average, farm real estate appreciated \$65,940 or 3.6 percent of beginning fair market value. Machinery appreciated 2.8 percent while dairy cattle prices appreciated 0.1 percent in 2010.

Average data from 20 farms with the highest rates of return to all capital (without appreciation) are compared with the 204 farm average in Table 8 and in many of the following tables. Net farm income without appreciation averaged \$1,016,663 per farm on the top 10 percent farms, 211 percent greater than the 204-farm average.

Table 6.

NET FARM INCOME 204 New York Dairy Farms, 2010

Item	Average 204 Farms		Average Top 10% Farms ¹⁰	
	Per Farm	Per Cow	Per Farm	Per Cow
Total accrual receipts	\$2,416,422		\$4,268,147

Net Farm Income (without appreciation)	\$326,482	\$668	\$1,016,663	\$1,251

¹⁰Average of 20 farms with highest rates of return to all capital (without appreciation).

Labor and management income is the part of net farm income without appreciation returned to the operator(s) labor and management. Appreciation is not included as part of the return to labor and management. Labor and management income is determined by deducting the charge for unpaid family labor and the cost of using equity capital at a real interest rate of five percent, from net farm income excluding appreciation. The interest charge reflects the long-term average rate of return above inflation that a farmer might expect to earn in comparable risk investments. Operator(s)' labor is not included in unpaid family labor.

Labor and management income per operator measures the return to one full-time operator's labor and management. A full-time operator provides 12 months of labor and management.

Table 7.

**LABOR AND MANAGEMENT INCOME
204 New York Dairy Farms, 2010**

Item	Average 204 Farms		Average Top 10% Farms ¹¹
Net farm income without appreciation	\$ 326,482		\$1,016,663
- Family labor unpaid @ \$2,500 per month	4,237		888

= Labor & Management Income (1.82 operators)	\$184,702	(1.92 operators)	\$770,358
Labor & Management Income per Operator	\$101,484		\$401,228

¹¹Average of 20 farms with highest rates of return to all capital (without appreciation).

Labor and management income per operator averaged \$101,484 on these 204 dairy farms in 2010. The range in labor and management income per operator was from less than \$-244,000 to more than \$1,070,000. Returns to labor and management were less than \$0 on 32 percent of the farms. Labor and management incomes per operator were between \$0 and \$100,000 on 38 percent of the farms while 30 percent showed labor and management incomes of \$100,000 or more per operator.

Chart 4.

**DISTRIBUTION OF LABOR AND MANAGEMENT INCOMES PER OPERATOR
204 New York Dairy Farms, 2010**

Return to equity capital measures the net return remaining for the farmer's equity or owned capital after a charge has been made for the owner/operator's labor and management and unpaid family labor. The earnings or amount of net farm income allocated to labor and management is the opportunity cost or value of operator(s) labor and management estimated by the cooperators. Return on equity capital is calculated with and without appreciation. The rate of return on equity capital is determined by dividing the amount returned by the year's average farm net worth or equity capital. Return to all capital is calculated by adding interest paid to the return on equity capital and then dividing by average farm assets to calculate the rate of return on average total capital. Net farm income from operations ratio is net farm income (without appreciation) divided by total accrual receipts.

Table 8.

**RETURN TO CAPITAL
204 New York Dairy Farms, 2010**

Item	Average 204 Farms	Average Top 10% Farms ¹²

without appreciation	6.5%	14.5%
Net farm income from operations ratio	0.14	0.24

¹²Average of 20 farms with highest rates of return to all capital (without appreciation).

Return to all labor and management is another measure of profitability of a business that can be calculated. It is calculated by adding the charge for unpaid family labor and the hired labor expense to labor and management income. Table 9 shows that farms with higher return to all capital with appreciation also had significantly higher return per hour to all labor and management.

Table 9.

Farm and Family Financial Status

Evaluating the financial status of the farm business and the farm family is an important part of business analysis. The first step is to inventory all the assets, determine all liabilities and fill out the balance sheet. The second step is to analyze the complete balance sheet by evaluating the relationships between assets and liabilities and changes made during the year.

Table 10.

Total Nonfarm	\$265,858	\$274,495			

¹³Average of 72 farms completing the nonfarm balance sheet.

¹⁴Sum of average farm values for 204 farms and nonfarm values for 72 farms.

Financial lease obligations are included in the balance sheet. The present values of all future payments are listed as liabilities since the farmer (lessee) is committed to making the payments. The present values are also listed as assets, representing the future value the item has to the business.

The farm balance sheet analysis includes financial and debt ratios and factors measuring levels of debt. Percent equity is calculated by dividing farm net worth by farm assets. Equity increases as the value of assets increase more than liabilities. The debt to asset ratios reflect strength in solvency and the potential capacity to borrow. The debt analysis ratios show how well the debt is structured and managed. The leverage ratio is the dollars of debt per dollar of equity, computed by dividing total farm liabilities by farm net worth. Debt levels per unit of productive capacity include some old standards that are still useful if used with measures of cash flow and repayment ability.

Table 11.

FARM BALANCE SHEET ANALYSIS

= Net Investment	39,374	2,176	44,990
+ Appreciation	<u>65,940</u>	<u>20,672</u>	<u>915</u>
Value end of year	\$1,937,436	\$773,211	\$1,089,056

¹⁶\$42,598 land and \$99,100 buildings and/or depreciable improvements.

¹⁷Gifts and inheritances of property transferred into the farm business from outside.

The Statement of Owner Equity has two purposes. It allows (1) verification that the accrual income statement and market value balance sheet are consistent (in accountants' terms they reconcile) and (2) identification of the causes of change in equity that occurred on the farm during the year. The Statement of Owner Equity allows the farmer to determine to what degree the changes in equity were caused by (1) earnings from the business, and nonfarm income, (in excess of withdrawals) being retained in the business (retained earnings), (2) outside capital invested in the business or farm capital removed from the business (called contributed/withdrawn capital) and (3) increases or decreases in the value (price) of assets owned by the business (called change in valuation equity).

Retained earnings are an excellent indicator of farm generated financial progress.

Cash Flow Summary and Analysis

Completing an annual cash flow statement is an important step in understanding and organizing the sources and uses of funds for the business. It is also a means useful in determining accuracy and completeness of the data. Understanding last year's cash flow is the first step in planning and managing cash flow for the current and future years.

The annual cash flow statement is structured to show net cash provided by operating activities, investing activities, financing activities and from reserves. All cash inflows and outflows are included. Therefore the sum of net cash provided from all four activities should be zero. Any imbalance is the error from incorrect accounting of cash flows.

Table 14.

ANNUAL CASH FLOW STATEMENT 204 New York Dairy Farms, 2010

Item	Average 204 Farms	
<u>Cash Flow from Operating Activities</u>		
Cash farm receipts	\$2,299,433

²⁰Exclude change in interest account payable.²¹Average of 20 farms with highest rates of return to all capital (without appreciation).

Repayment Analysis

The second step in cash flow planning and management is to compare and evaluate debt payments planned and made last year, and then to estimate the payments required in the current year. It is helpful to compare and evaluate a farm's repayment position by using debt payments per unit of production and receipt/debt payment ratios. The data below are from farms that completed summaries for both 2009 and 2010.

Table 16.

FARM DEBT PAYMENTS PLANNED 185 New York Dairy Farms, 2010

Debt Payments	185 Dairy Farms			20 Top 10% Farms		
	2010 Payments		Planned	2010 Payments		Planned
	Planned	Made	2011	Planned	Made	2011
Long term	\$ 64,780	\$ 79,780	\$ 77,303	\$ 60,045	\$ 122,211	\$ 105,332
Intermediate term	150,248	174,855	166,465	218,045	269,424	222,151
Short term	4,468	4,092	4,588	0	0	13,972
Operating (net reduction)	14,798	34,410	9,500	27,778	38,251	15,000
Accts. payable (net reduction)	4,430	31,366	3,797	5,556	75,687	0
Total	\$238,724	\$324,403	\$261,653	\$311,423	\$505,572	\$356,455
Per cow	\$467	\$635		\$369	\$600	
Per cwt. 2010 milk	\$1.89	\$2.57		\$1.40	\$2.27	
Percent of 2010 milk receipts	11%	14%		8%	13%	

The cash flow coverage ratio and debt coverage ratio measure the ability of the farm business to meet its planned debt payments from normal operation of the business. Debt coverage ratio indicates the income generated to make payments while cash flow coverage ratio shows the cash available to make payments.

Table 17.

COVERAGE RATIOS 185 New York Dairy Farms, 2010

Item	Average	Item	Average
<u>Cash Flow Coverage Ratio</u>		<u>Debt Coverage Ratio</u>	
Cash farm receipts	\$2,422,175	Net farm income (without appreciation)	\$347,620
- Cash farm expenses	2,063,625	+ Depreciation	166,514
+ Interest paid (cash)	66,195	+ Interest paid (accrual)	66,319
- Net personal withdrawals from farm ²²	104,903	- Net personal withdrawals from farm ²²	104,903
(A) = Amount Available for Debt Service	\$319,842	(A') = Repayment Capacity	\$475,550
(B) = Debt Payments Planned for 2010 (as of December 31, 2009)	\$238,725	(B) = Debt Payments Planned for 2010 (as of December 31, 2009)	\$238,725
(A/B)= Cash Flow Coverage Ratio for 2010	1.34	(A'/B)= Debt Coverage Ratio for 2010	1.99

20 Top 10% Dairy Farms, 2010			
(A) = Amount Available for Debt Service	\$735,385	(A') = Repayment Capacity	\$1,215,180
(B) = Debt Payments Planned for 2010	311,423	(B) = Debt Payments Planned for 2010	311,423
(A/B)= Cash Flow Coverage Ratio for 2010	2.36	(A'/B)= Debt Coverage Ratio for 2010	3.90

²²Personal withdrawals and family expenditures less nonfarm income and nonfarm money borrowed. If excluded, the coverage ratios will represent repayment ability of the farm only.

The debt to asset ratio is a good measure of the current relationship between assets and liabilities, but not the business' ability to meet cash flow obligations. Even with a debt to asset ratio of less than 40 percent, 15.7 percent of the farms had a cash flow coverage ratio less than 1.0.

Table 18.

DEBT TO ASSET RATIO VS. CASH FLOW COVERAGE 204 New York Dairy Farms, 2010

Debt/Asset Ratio	Cash Flow Coverage Ratio (Farm & Nonfarm)			
	<.5	.5 to .99	1 to 1.49	>=1.5
	percent of farms			
<40%	4.9	10.8	12.2	29.9
40 to 60%	7.8	11.3	8.8	5.9
60% & over	2.9	2.0	2.5	1.0

Cropping Program Analysis

The cropping program is an important part of the dairy farm business that is sometimes overlooked and often neglected. A complete evaluation of available land resources, how they are used, and what it costs to produce the crops, are required to evaluate alternative cropping and feed purchase choices.

Table 19.

Tillable pasture	33	84		2	340	
Idle	34	57		3	60	

²³Average of 20 farms with highest rates of return to all capital (without appreciation).

Crop acres and yields are the average for the farms reporting each crop. All but seven of the 204 farms produced hay or hay crop silage in 2010. Eighty-nine percent produced corn silage, 53 percent grew and harvested corn grain, and nine percent grew oats for grain. Although 33 farms used tillable pasture in 2010, only 27 of the 204 farms reported using rotational grazing.

Yields of forage crops have been converted to tons of dry matter using dry matter coefficients reported by the farmers. Grain production has been converted to bushels of dry grain equivalent.

Crop acres represent planted acres, therefore, any unharvested acres are reflected in lower yields per acre.

The following measures of crop management indicate how effectively the land resource is being used and how well total forage requirements are being met. These measures are the averages of farms that grow forages.

Table 20.

CROP MANAGEMENT FACTORS 204 New York Dairy Farms, 2010

Item	Average 204 Farms	Average Top 10% Farms ²⁴
Total tillable acres per cow	2.05	1.80
Total forage acres per cow	1.71	1.51
Harvested forage dry matter, tons per cow	8.25	7.64

²⁴Average of 20 farms with highest rates of return to all capital (without appreciation).

Crop input costs per tillable acre are reported in the table below. The chart below shows the relationship between total forage dry matter per acre and total crop input costs.

Table 21.

Chart 5.

CROP EXPENSE PER ACRE BY TOTAL FORAGE PRODUCTION PER ACRE
198 New York Dairy Farms That Grow Forages, 2010

Most machinery costs are associated with crop production and should be analyzed with the crop enterprise. Total machinery expenses include the major fixed costs (interest and depreciation), as well as the accrual operating costs. Machinery costs have not been allocated to individual crops, but they are calculated per total tillable acre.

Table 22.

ACCRUAL MACHINERY EXPENSES
198 New York Dairy Farms That Grow Forages, 2010

Machinery Expense Item	Average 198 Farms		Average Top 10% Farms ²⁶	
	Total Expenses	Per Tillable Acre	Total Expenses	Per Tillable Acre

Total	\$354,684	\$349.76	\$525,508	\$359.19

²⁶Average of 20 farms with highest rates of return to all capital (without appreciation) that grow forages.

The trend lines on charts on the previous and following pages were completed using regression techniques. The predictive formulas and R^2 are presented for each relationship. An R^2 of 1.00 indicates a perfect relationship between the data and the trend line. An R^2 of .30 for example, is interpreted as the trend line explaining 30% of the variability in the relationship. The higher the R^2 , the better the trend line fits the data. With a low R^2 , other factors, not measured, are important in explaining the relationship. The very low R^2 value for Chart 12 indicates little statistical relationship in the 2010 data.

The charts below show the relationship between the stocking rate (forage and grazing acres per cow) and labor and management income per operator per cow and real estate investment per cow. Stocking rate is total tillable acres plus nontillable pasture acres less corn grain acres, all divided by the average number of cows.

Chart 6.

Chart 7.

Dairy Program Analysis

An analysis of the dairy enterprise can be the most important step in evaluating the strengths and weaknesses of the dairy farm business. Changes in dairy herd size and market values are identified in the table below. The change in inventory value without appreciation is attributed to physical changes in herd size and quality. This change in inventory is included as an accrual farm receipt when calculating profitability.

Table 23.

²⁷Average of 20 farms with highest rates of return to all capital (without appreciation).

Historically, there has been a strong relationship between farm size and net farm income on well-managed dairy farms. In 2010, there was a consistent increase in net farm incomes as herd size increased (Chart 8). For more information on herd size comparisons, see pages 48-57.

Chart 8.

NET FARM INCOME (WITHOUT APPRECIATION) BY HERD SIZE 204 New York Dairy Farms, 2010

Total milk sold and milk sold per cow are extremely valuable measures of productivity on the dairy farm. These measures of milk output are based on pounds of milk marketed during the year. Milk components per cow in the table below are an average of 140 farms that provided the data.

Table 24.

**MILK PRODUCTION
204 New York Dairy Farms, 2010**

Item	Average 204 Farms	Average Top 10% Farms ²⁸
Total milk sold, pounds	11,978,152	20,682,529
Milk sold per cow, pounds	24,508	25,454
	<u>Average 140 Farms</u>	<u>Average 20 Farms</u>
Butterfat per cow, pounds	907	924
Protein per cow, pounds	763	775
Total butterfat and protein per cow, pounds	1,670	1,699
Other solids per cow, pounds	1,447	1,459
Total components per cow, pounds	3,117	3,158

²⁸Average of 20 farms with highest rates of return to all capital (without appreciation).

Farms with higher rates of production tend to have higher net farm incomes. This is due to more cows per farm, not necessarily higher net farm income per cow. In 2010, farms with higher milk production per cow and more cows did have higher labor and management incomes per operator.

Table 25.

**MILK SOLD PER COW AND FARM INCOME MEASURES
204 New York Dairy Farms, 2010**

Pounds of Milk Sold Per Cow	Number of Farms	Average Number of Cows	Net Farm Income without Appreciation	Net Farm Income Per Cow	Labor & Management Income/Operator
Under 16,000	18	162	\$72,970	\$451	\$14,811
16,000 to 17,999	20	148	41,659	282	-3,901
18,000 to 19,999	15	117	54,870	467	5,017
20,000 to 21,999	30	219	137,234	626	17,213
22,000 to 23,999	36	503	225,914	449	51,518
24,000 to 25,999	40	716	448,328	626	131,726
26,000 & over	45	861	743,325	863	250,338

The relationship between milk output per cow and net farm income on all dairy farms is shown in Table 27 above and is diagrammed in Charts 9 and 10 on page 26. Each spot on each scatter diagram represents one of the 204 Farms.

Historically, net farm income per cow has increased as pounds of milk sold per cow increased. This relationship held true in 2010 (see Table 27 and Charts 9 and 10). As pounds of milk sold per cow increased, total net farm income increased as did net farm income per cow, with some fluctuation.

Chart 9.

Chart 10.

Charts 11 and 12 show relationships between cull rates and milk production and net farm income per cow. For the 2010 year, supplementary information concerning dairy replacements was collected from 29 participating farms. The culling chart (Table 26) reports the decile range of reported factors for the different information that was collected. The average culling rate was 34 percent, sell rate was 28 percent, and death rate was 7 percent. The average number of cows sold for beef equaled 135, six cows were sold for dairy, and 32 cows died. Please refer to the glossary for definitions of the different terms and how the measures were calculated.

Chart 11.

Chart 12.

Table 26.

CULLING RATE AND DAIRY REPLACEMENT INFORMATION
New York Dairy Farms, 2010

Decile	Sell Rate	Death Rate	Cull Rate	Value of Cows Sold	Value of Animals Purchased	Percent of Replacements Purchased	Percent of Heifers Custom Raised

²⁹204 DFBS farms provided culling information. Twenty-nine farms provided supplemental information on heifer acquisitions.

Cost of Producing Milk

The cost of producing milk has been compiled below using the whole farm method. The following steps are used in the calculations.

1. The cost of expansion livestock is added to total accrual operating expenses to offset any related inventory increase included in accrual receipts.
2. Accrual milk sales are deducted from total accrual receipts to get total accrual nonmilk receipts, which are used to represent total nonmilk operating costs. This assumes that costs equal revenues for nonmilk costs.
3. Total accrual nonmilk receipts are subtracted from total accrual operating expenses including expansion livestock to calculate the operating cost of producing milk.
4. Machinery depreciation and building depreciation are added to operating costs to determine the purchased inputs cost of producing milk.
5. The opportunity cost of equity capital, operator's labor and operator's management and the value of unpaid family labor are added to all other costs to obtain the total cost of producing milk. This cost includes all the operating, depreciation, and imputed costs of producing milk.

Table 27.

Total Cost Per Cwt.	\$17.06	\$14.89

³⁰Average of 20 farms with highest rates of return to all capital (without appreciation).

Costs of producing milk per hundredweight are presented for eight expenditure categories in Table 28. The whole farm method assumption that accrual nonmilk receipts represent nonmilk operating costs is used in computing net costs. A \$43,732 average increase in crop inventories per farm, (\$0.37 per hundredweight of milk), is included in crop sales on the 204 farms. The top 10 percent farms had a \$102,716 average increase in crop inventories per farm (\$0.50 per hundredweight of milk).

³²Average of 20 farms with highest rates of return to all capital (without appreciation).

Costs of producing milk per hundredweight are presented in the table below for 185 farms that participated both in 2009 and 2010. Costs of production decreased in nearly all expense categories except net machinery expense, net livestock expense, real estate expense and net miscellaneous expense when 2010 data were compared to 2009.

Table 29.

Net Farm Income with Appreciation	\$413,954	\$847	\$3.46	\$1,109,390	\$1,365	\$5.36

³⁴Average of 20 farms with highest rates of return to all capital (without appreciation).

The operating cost of producing milk on all 204 dairy farms averaged \$13.76 per hundredweight, leaving \$4.05 to cover depreciation, unpaid labor and operator resources.

The total cost of producing milk on the 204 dairy farms averaged \$17.06 per hundredweight, \$0.75 less than the average price received for milk sold from these farms during 2010. The imputed costs or charge for the operator's labor, management and equity capital averaged \$1.95 per hundredweight in 2010; however, the farm operator received \$2.70 per hundredweight for these inputs. The 20 most profitable farms held their operating costs to \$12.01 per hundredweight and their total cost of producing milk averaged \$14.89 per hundredweight. This left a profit of \$3.15 per hundredweight of milk sold.

The strong relationship between milk output per cow and the total cost of producing milk is shown in Table 31 and Chart 13 on page 32. Farms selling less than 20,000 pounds of milk per cow had average total costs of production of \$20.84 per hundredweight while those selling 20,000 pounds and over averaged \$17.31 for a difference of \$3.53 per hundredweight.

Table 31.

**FARM COST OF PRODUCING MILK BY MILK SOLD PER COW
204 New York Dairy Farms, 2010**

Pounds Milk Sold Per Cow	Costs per Hundredweight					Accrual Receipts From Milk Per Cwt.	Return Per Cwt. To Operator's Labor, Mgmt. & Capital
	Operating Costs		Costs of Producing Milk				
	Hired Labor	Dairy Grain & Concentrate	Total Operating	Purchased Inputs	Total		
Under 16,000	\$2.18	\$4.82	\$13.42	\$15.33	\$20.18	\$18.98	\$3.27
16,000-17,999	2.22	5.61	15.60	17.18	21.70	18.84	1.33
18,000-19,999	1.62	5.20	14.81	16.25	20.65	18.72	1.93
20,000-21,999	2.07	4.92	12.77	14.55	18.34	17.52	2.84
22,000-23,999	2.55	5.17	14.54	15.79	17.70	17.74	1.94
24,000-25,999	2.71	5.16	13.88	15.20	16.87	17.70	2.49
26,000 & over	2.70	4.97	13.39	14.66	16.34	17.83	3.16

Chart 13.

The relationship between total cost of producing milk and milk sold per cow is diagrammed in Chart 14. It shows that as milk sold per cow increases, on the average, total cost of production generally decreases.

Chart 14.

Data in Table 32 and Chart 15 show that the average total cost of production generally declines as herd size increases. This is attributable to spreading fixed costs over more units of output.

Total operating costs are lowest at the under 60 herd size group and generally increase as herd size increases. Hired labor cost increases with herd size, while purchased dairy grain and concentrate are not related to herd size.

Table 32.

**FARM COST OF PRODUCING MILK BY HERD SIZE
204 New York Dairy Farms, 2010**

Number of Cows	Costs per Hundredweight					Accrual Receipts From Milk	Return Per Cwt. To Operator's Labor, Mgmt. & Capital
	Operating Costs		Costs of Producing Milk				
	Hired Labor	Dairy Grain & Concentrate	Total Operating	Purchased Inputs	Total		
Under 60	\$0.51	\$4.91	\$13.45	\$14.88	\$23.00	\$17.54	\$1.46

900 and over	2.76	5.04	13.48	14.86	16.41	17.65	2.79

Chart 15.

**PRODUCTION COST BY HERD SIZE
204 New York Dairy Farms, 2010**

The importance of cost control and its impact on farm profitability are illustrated in Chart 16. As the total cost of producing milk per hundredweight increased, net farm income per cow fell. All farms had a positive net farm income per cow until the total cost of producing milk exceeded \$18 per hundredweight. The majority of the farms experienced positive net farm incomes per cow in 2010.

Chart 16.

Cost of Producing Milk (continued)

A ten-year comparison of the average costs and returns of producing milk per hundredweight is presented in Table 33 on page 36. Average individual operating and overhead expenses per hundredweight of milk sold are reported on all specialized dairy farms included in the New York State Summary from 2001 through 2010. In 2010, the average operating cost of producing milk increased 0.4 percent after decreasing 9.9 percent from 2008 to 2009. The average return per hundredweight to operator labor, management, and capital was \$3.85 higher in 2010, 332 percent greater than 2009. In only four years during the last ten years has milk price exceeded the total cost of producing a hundredweight of milk. The years were 2001, 2004, 2007, and 2010.

Hired labor expense per hundredweight has increased consistently from 2000 to 2004, remained constant in 2005, decreased three percent in 2006, increased five percent in 2007, increased three percent in 2008, decreased three percent in 2009, and decreased another three percent in 2010. Hired labor expense was \$2.41 in 2001 and has risen to \$2.61 in 2010. Thus, even as pounds of milk sold per worker have increased from 897,167 in 2001 to 1,095,897 in 2010, labor expense per worker has also increased. Some of this effect is due to increasing farm size where a larger portion of the labor force is comprised of hired workers. Another effect is an increase in hired labor cost per worker as shown by a 13 percent increase in hired labor expense per hired worker equivalent from 2001 to 2010.

Purchased feed expense per hundredweight of milk can fluctuate greatly, as much as \$2.07 per hundredweight. At \$4.10 in 2002, it was at its lowest in the past ten years. In 2008, purchased feed expense was at its highest in the past ten years at \$6.17, due mostly to demand for corn for ethanol and the U.S. dollar foreign exchange rate. Purchased feed expense decreased one percent in 2010 to \$5.41 per hundredweight.

Interest paid on debt per hundredweight of milk sold has fluctuated over this period. In 2001, interest expense was \$0.82 per hundredweight. In 2009, interest expense was at a ten-year low of \$0.51 per hundredweight. In 2010, interest expense increased slightly to \$0.53 per hundredweight. Property taxes per hundredweight of milk were fairly constant during this ten-year period. Property taxes were \$0.21 per hundredweight in 2001 and \$0.22 in 2010. This is due to productivity increases and more of the land resources being rented, rather than owned, and fewer acres per cow.

A ten-year comparison of selected average business factors for all specialized DFBS farms is presented in Table 34 on page 37. The reader is reminded that the same farms are not in the survey each year. Average cow numbers are up 77 percent, tillable acres have increased 60 percent, and milk sold per farm has jumped 99 percent since 2001. Capital investment per cow has increased 35 percent over the last ten years. Labor and management income per operator increased 169 percent in 2010 compared to 2009, farm net worth increased 14 percent, and percent equity increased 5 percent in 2010 compared to 2009.

Hay crop yields were 2.8 tons dry matter per acre in 2001 and 3.5 tons dry matter per acre in 2010. Corn silage yields, as fed, have varied more widely and were at a ten-year high of 19.9 tons per acre in 2008, decreased to 18.7 tons per acre in 2009, and increased to 19.6 tons per acre in 2010. As yields increased from 2009 to 2010, fertilizer and lime expense increased \$1 per tillable acre, from \$42 to \$43 per acre. Pounds of milk sold per cow increased by 12.6 percent, from 21,762 pounds in 2001 to 24,508 pounds in 2010.

Average number of workers per farm increased by 4.21 and operators/managers per farm were stable. Cows per worker equivalent increased from 41 in 2001 to 45 in 2010, but labor cost per cow increased from \$706 to \$771 over the same time period.

The asset turnover ratio ranged from a low of 0.44 in 2009 to a high of 0.67 in 2007. Total accrual receipts as a proportion of total farm assets equals asset turnover ratio. Percent equity was 60 percent in 2001, was relatively constant over the next five years, increased to 68 percent in 2007 and 2008, decreased to 62 percent in 2009, and increased to 65 percent in 2010.

Table 33.

TEN YEAR COMPARISON: AVERAGE COST OF PRODUCING MILK PER HUNDREDWEIGHT
New York Dairy Farms, 2001 to 2010

Item	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010

The average or mean price per hundredweight of milk sold is calculated by dividing gross milk receipts by total pounds of milk sold. The average price for the 204 farms was \$17.81 but there was considerable variation among the individual farms. The variation in average price received and the distribution of farms around the mean are shown below.

Chart 17.

Forty-seven percent of the farms received from \$17.50 to \$18.50 per hundredweight of milk sold. Nineteen percent of the farms received \$18.50 or more and 34 percent received less than \$17.50 per hundredweight. Location and organization of markets are factors contributing to the difference in average milk prices on these dairy farms. Management practices on farms as well as in milk companies also affect farm milk prices. Seasonality of production and milk components are two variables that affect milk price. More milk price analysis can be found on pages 40 and 41.

The accrual operating expenses most commonly associated with the dairy enterprise are listed in the table below. Evaluating these costs per unit of production enables the comparison of different size dairy farms for strengths and areas for improvement.

Table 35.

**DAIRY RELATED ACCRUAL EXPENSES
204 New York Dairy Farms, 2010**

Other livestock expense	34	.14	25	.10

³⁶Average of 20 farms with highest rates of return to all capital (without appreciation).

Feed costs per cow and per hundredweight of milk sold are influenced by a number of factors. These cost measures are affected by the amount of homegrown grains fed, quality and quantity of the roughage harvested, and the number of youngstock. Feed costs are also influenced by the farmer's ability to purchase grains and concentrates at reasonable prices and to balance nutrients fed with energy and protein requirements.

Purchased dairy grain and concentrates per cow is calculated by dividing the total accrual expenses for dairy grains and concentrates purchased by the average number of cows. Because this also included the amount spent for calf and heifer feed, it actually represents feed cost for one cow and associated replacements being raised (averaged 0.85 animals in 2010).

Purchased feed and crop expense per hundredweight of milk is one of the most useful feed cost measures because it accounts for some of the variations in feeding and cropping programs, and milk production between herds. It includes all purchased feeds used on the farm, and it includes crop expenses that are associated with feed production. It does not represent total feed costs because machinery, labor and other costs of producing feed crops are excluded.

Purchased grain and concentrates as percent of milk sales is calculated by dividing feed purchased by milk receipts. This is another useful measure of feed efficiency although variations in homegrown grains fed, heifers fed, and milk prices can have an impact. Purchased feed and crop expense as percent of milk sales removes much of the variation caused by the feeding of home grown grains.

Cost control has an important effect on farm profitability. The relationship between purchased feed and crop expense per hundredweight of milk and farm profitability is shown below. On average, farms with feed and crop expenses exceeding \$6.50 reported below average profits in 2010. Net milk income over purchased concentrate per cow shows a similar relationship when compared to rate of return on assets without appreciation (Chart 18).

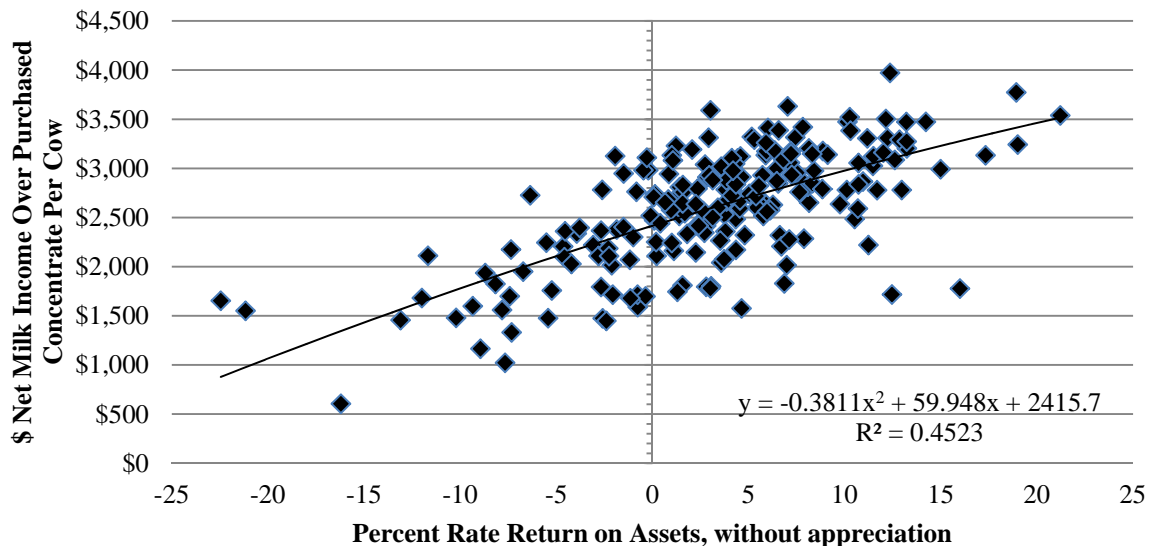

Table 36.

204 New York Dairy Farms, 2010**

Milk Income and Marketing Expense Breakdown

Starting January 1st, 2000, the Northeast switched to multiple component pricing, which changed the format of the milk check and how farmers received payment for their milk. To examine the breakdown of the gross milk income and the marketing expenses, 140 farms filled out a detailed form including all the different sources of income for milk sales and the milk marketing expenses on an accrual basis. This information is reported in the following two tables. The tables are divided into six different sections, each representing a different area of income or expense. The cumulative total for these six sections is the net price received on farms. MILC payments are not included as a milk receipt, but as a government receipt.

Table 37 reports the averages for the 140 farms providing the data. Table 38 on page 41 contains the quintile averages for each of the individual lines of the report. This table is in a farm business chart format with each item sorted independently and ranked by fifths. Numbers for the different sections will not add to the totals for that quintile or to the net price received because each item is sorted independently. This table shows the range of income and expenses received by farms for all the different sections. More milk price information was presented on page 38.

Table 37.

AVERAGE³⁷ MILK INCOME AND MARKETING REPORT
140 New York Dairy Farms, 2010

	Pounds	Percent	Price/Pound	Total	\$/Cwt of Milk
BASE FARM PRICE

Total Deductions					\$0.91
BASE FARM PRICE + PREMIUMS – DEDUCTIONS					
Marketing Programs					
Futures Contracts, Forward Contracting, Etc.				\$-813	\$-0.01
Total Marketing Income					\$-0.01
Patronage Dividends				\$28,313	\$0.19
NET PRICE RECEIVED ON FARM, ALL SOURCES					
PPD – Hauling, per cwt.					\$1.08
PPD – Hauling + Market Premiums, per cwt.					\$1.64
Net Marketing Value, per cwt. (PPD + Total Premiums - Total Deductions)					\$1.92

³⁷Each calculation of an average is independent of all others. Therefore, math operations on the detail will not result in the totals. However, detail in the “\$/Cwt of Milk” column will result in the totals. Average herd size for these 140 farms is 599 cows.

Capital and Labor Efficiency Analysis

Capital efficiency factors show how intensively capital is being used in the farm business. Capital efficiency can be measured as investment per worker and per cow. It can also be measured in terms of the relationship to farm receipts.

Table 39.

CAPITAL EFFICIENCY				
204 New York Dairy Farms, 2010				
Item (Average for Year)	Per Worker	Per Cow	Per Tillable Acre	Per Tillable Acre Owned
Farm capital	\$408,735	\$9,141	\$4,525	\$9,032
Real estate		\$3,857		\$3,811
Machinery & equipment	\$70,206	\$1,570	\$777	
<u>Ratios</u>				
Asset turnover	Operating Expense	Interest Expense		Depreciation Expense
0.56	0.77	0.03		0.07
<u>Average Top 10% Farms:³⁹</u>				
Farm capital	\$410,251	\$8,255	\$4,585	\$8,525
Real estate		\$3,350		\$3,459
Machinery & equipment	\$63,516	\$1,278	\$710	
<u>Ratios</u>				
Asset turnover ratio	Operating Expense	Interest Expense		Depreciation Expense
0.65	0.69	0.02		0.05

³⁹Average of 20 farms with highest rates of return to all capital (without appreciation).

Asset turnover ratio measures the relationship between capital investment and farm receipts. It is computed by dividing the year's total farm accrual receipts including appreciation by the average farm assets. The relationship the asset turnover ratio has to farm profitability and other factors is shown in the following table. As a general rule, dairy farmers should aim for an asset turnover ratio of 0.6 or higher. The operational ratios reflect the relationship of expense categories to total farm receipts. The sum of the operating, interest, and depreciation expense ratios expresses total farm expenses per dollar of total farm receipts.

Table 40.

ASSET TURNOVER AND PROFITABILITY						
204 New York Dairy Farms, 2010						
Ratio	Number of Farms	Number of Cows	Farm Capital (average for year)		Labor & Management Income Per Operator	Net Farm Income (without appreciation)
			Per Cow	Per Worker		
≥ .60	56	809	\$7,618	\$363,151	\$256,314	\$642,281
.50 to .59	47	699	9,612	423,731	110,916	436,685
.40 to .49	46	316	10,604	468,696	35,686	183,051
Less than .40	55	128	13,735	470,114	-28,516	30,730

Measures of labor efficiency are key indicators of the work accomplished by an average worker. The 20 farms with the highest rates of return on all capital (without appreciation) were above the average of all 204 farms in all measures of labor efficiency except tillable acres per worker. The top 10 percent averaged five more cows per worker and sold 15 percent more milk per worker than the average of all farms.

Table 41.

LABOR EFFICIENCY				
204 New York Dairy Farms, 2010				
Labor Efficiency	Average Farms		Average Top 10% Farms ⁴¹	
	Total	Per Worker ⁴⁰	Total	Per Worker ⁴⁰
Cows, average number	489	45	813	50
Milk sold, pounds	11,978,152	1,095,897	20,682,529	1,265,051
Tillable acres	987	90	1,463	89

⁴⁰The method used to calculate worker equivalent incorporates the number of hours actually worked by the owner/operators, instead of using a standard 12 months for each full-time owner/operator of the business. A full-time month is specified to be 230 hours of labor per month.

⁴¹Average of 20 farms with highest rates of return to all capital (without appreciation).

The labor force averaged 10.93 full-time worker equivalents per farm (based on 230 hours per month). Eighteen percent of the labor was supplied by the farm operator/managers. There were two operators on 131 farms, three on 51 farms, and 25 farms reported four or more operators.

Labor costs, labor efficiency, and farm profitability are closely related. Farms with high rates of return can attribute some of their success to the control of labor and machinery costs. Labor and machinery costs average \$1,395 per cow and \$5.48 per hundredweight on the 20 farms in the top decile.

Table 42.

⁴²See footnote number 40 in Table 41.

⁴³Average of 20 farms with highest rates of return to all capital (without appreciation).

The relationship of labor efficiency to net farm income and labor and management income per operator is usually positive over the range of efficiency levels. The higher outputs of milk sold per worker are partially attributable to higher producing cows. In 2010, increased labor efficiency did result in larger net farm incomes.

Table 43.

Farm Business Charts

The Farm Business Chart is a tool which can be used in analyzing a business by drawing a line through the figure in each column which represents the current level of management performance. The figure at the top of each column is the average of the top 10 percent of the 204 Farms for that factor. The other figures in each column are the average for the second 10 percent, third 10 percent, etc. **Each column of the chart is independent of the others.** The farms which are in the top 10 percent for one factor would not necessarily be the same farms which make up the top 10 percent for any other factor.

The cost control factors are ranked from low to high, but the lowest cost is not necessarily the most profitable. In some cases, the "best" management position is somewhere near the middle or average. Many things affect the level of costs, and must be taken into account when analyzing the factors.

Table 44.

FARM BUSINESS CHART FOR FARM MANAGEMENT COOPERATORS 204 New York Dairy Farms, 2010

The profitability section shows the variation in farm income by decile and enables a dairy farmer to determine where he or she ranks by using several measures of farm profitability. Remember that each column is independently established and the farms making up the top decile in the first column will not necessarily be on the top of any other column. The dairy farmer who ranks at or near the top of most of these columns is in a very enviable position.

Farm Business Charts for farms with freestall barns and 200 cows or less, 200 to 400 cows, and more than 400 cows, and farms with conventional barns with less than 60 cows and equal to or more than 60 cows are discussed in the supplemental section on pages 66-70.

Financial Analysis and Management

Analysis and astute management of farm financial affairs must receive high priority if the farm business is to be successful and if the farm family is to achieve a reasonable living standard.

The farm finance checklist and the financial analysis chart are provided to serve as guidelines. Dairy farmers can determine how their financial management measures up by comparing with average data from other farms.

Table 45.

A FARM FINANCE CHECKLIST 204 New York Dairy Farms, 2010

	Average 204 Farms		Average Top 10% Farms ⁴⁴	
<u>How farm assets are being used (average for the year):</u>				
Total assets (capital) per cow	\$9,141		\$8,255	
Farm assets in livestock	24%		25%	
Farm assets in farm real estate	42%		41%	
Farm assets in machinery	17%		15%	
<u>Measures of debt capacity & debt structure:</u>				
Equity in the business	65%		76%	
Farm debt per cow	\$3,207		\$2,026	
Long term debt/asset ratio ⁴⁵	0.32		0.17	
Intermediate & current term debt/asset ratio ⁴⁵	0.36		0.29	
Intermediate & current term debt as % of total debt	61%		72%	
<u>Debt repayment ability:</u> ⁴⁶				
Cash flow coverage ratio	1.34		2.36	
Debt coverage ratio	1.99		3.90	
Debt payments made per cow	\$635		\$600	
Debt payments made as % of milk receipts	14%		13%	
<u>Indicators of annual financial progress:</u>				
	<u>Amount</u>	<u>Percent</u>	<u>Amount</u>	<u>Percent</u>
Annual change in farm assets	+\$280,166	+6.5%	+\$671,879	+10.5%
Annual change in farm debt	-\$ 20,409	-1.3%	-\$205,629	-10.8%
Annual change in farm net worth	+\$300,575	+11.0%	+\$877,509	19.6%

⁴⁴Twenty farms with highest rates of return on all capital (without appreciation).

⁴⁵Long or intermediate and current term debt divided by long or intermediate and current term assets.

⁴⁶Average of 185 farms that participated in DFBS both in 2009 and 2010. Eighteen top 10 percent farms that participated both years.

The most profitable farms carried \$1,181 less debt per cow, the average equity in their businesses was 11 percent higher than that of the average of all 204 farms, and they had a greater ability to make 2011 debt payments when measured by cash flow coverage ratio and debt coverage ratio. Because, with higher income they were able to pay down debt, it does not mean that lower debt farms are more profitable.

Average farm assets grew 6.2 percentage points faster than debt during 2010 on the 204 dairy farms. Average farm net worth increased 11 percent.

The farm financial analysis chart is designed just like the farm business chart on pages 44-45 and may be used to measure the financial health of the farm business. Most of the financial measures are defined on pages 16, 18, 22, and 42 in this publication.

⁴⁷Dollars of debt per dollar of equity, computed by dividing total liabilities by total equity.

⁴⁸Return on all farm capital (no deduction for interest paid) divided by total farm assets.

Herd Size Comparisons

The 204 New York dairy farms have been sorted into seven herd size categories and averages for the farms in each category are presented in Tables 47 through 54. Note that after the less than 60 cow category, the herd size categories increase by 40 cows up to 100 cows, by 100 cows up to 200 cows, by 200 cows up to 600 cows and by 300 cows up to 900 cows.

In most years, as herd size increases, the net farm income increases (Table 47); and that was generally the case for 2010. Net farm income without appreciation averaged \$24,201 per farm for the less than 60 cow farms and \$1,030,251 per farm for those with more than 900 cows. Return to all capital without appreciation generally increased as herd size increased. With herd sizes between 60 and 200 cows, many farms find it difficult to find a low cost combination of technology and labor to produce milk. Thus profits are lower for these herds than other herd sizes.

It is more than size of herd that determines profitability on dairy farms. Farms with 900 and more cows averaged \$715 net farm income per cow while 60 cows or less dairy farms averaged \$509 net farm income per cow. The over 900 herd size category had the highest net farm income per cow while the 60 to 99 herd size category had the lowest net farm income per cow at \$210. Other factors that affect profitability and their relationship to the size classifications are shown in Table 48.

Table 47.

COWS PER FARM AND FARM FAMILY INCOME MEASURES 204 New York Dairy Farms, 2010

Number of Cows	Number of Farms	Average Number of Cows	Net Farm Income Without Appreciation	Net Farm Income Per Cow	Labor & Management Income Per Operator	Return to All Capital Without Appreciation
Under 60	24	48	\$24,201	\$509	\$-8,307	-3.4%
60 to 99	23	76	16,052	210	-15,740	-3.5%
100 to 199	42	139	67,455	484	-978	1.3%
200 to 399	26	290	190,350	657	58,665	5.6%
400 to 599	25	490	325,488	665	89,346	6.8%
600 to 899	30	740	490,148	662	153,264	7.3%
900 & over	34	1,440	1,030,251	715	273,170	7.9%

This year, net farm income per cow did generally exhibit the usual increase as herd size increased. All herd size categories except the largest category saw an increase in operating cost of producing milk from a year earlier (Table 48). Net farm income per cow will increase as farms become larger if the costs of increased purchased inputs are offset by greater and more efficient output.

The farms with more than 900 cows averaged more milk sold per cow than any other size category (Table 48). With 25,649 pounds of milk sold per cow, farms in the largest herd size group averaged 9.6 percent more milk output per cow than the average of all herds in the summary with less than 900 cows.

Many dairy farmers who have been willing and able to employ and manage the labor required to milk three times per day have been successful. Only four percent of the 47 DFBS farms with less than 100 cows used a milking frequency greater than two times per day. As herd size increased, the percent of herds using a higher milking frequency increased. Farms with 100 to 200 cows reported five percent of the herds milking more often than two times per day, the 200-399 cow herds reported 58 percent, 400-599 cow herds reported 64 percent, 600-899 cow herds reported 87 percent, and the 900 cow and larger herds reported 94 percent exceeding the two times per day milking frequency.

Table 48.

**COWS PER FARM AND RELATED FARM FACTORS
204 New York Dairy Farms, 2010**

Number of Cows	Average Number of Cows	Milk Sold Per Cow (lbs.)	Milk Sold Per Worker (cwt.)	Tillable Acres Per Cow	Forage DM Per Cow (tons)	Farm Capital Per Cow	Cost of Producing Milk Per Cwt.	
							Operating	Total
Under 60	48	19,166	4,623	3.6	8.7	\$12,659	\$13.45	\$23.00
60 to 99	76	19,147	5,506	2.8	7.9	11,324	15.01	22.60
100 to 199	139	19,898	7,011	3.0	8.6	12,187	13.89	20.08
200 to 399	290	24,039	9,889	2.0	8.0	9,051	13.90	17.28
400 to 599	490	22,956	9,990	2.4	8.2	8,201	13.95	17.35
600 to 899	740	24,921	11,249	2.0	7.9	8,887	14.16	17.11
900 & over	1,440	25,649	12,576	1.8	8.4	8,980	13.48	16.41

Milk output per worker has always shown a strong correlation with herd size. The farms with 100 cows or more averaged over 1,125,600 pounds of milk sold per worker while the farms with less than 100 cows averaged less than 509,700 pounds per worker.

In achieving the highest productivity per cow and per worker, the largest farms had the fewest crop acres per cow and above average forage dry matter harvested per cow. The 400 to 599 herd size group had the more efficient use of farm capital with an average investment of \$8,201 per cow.

The 34 farms with 900 or more cows had the lowest total cost of producing milk at \$16.41 per hundredweight. This is \$1.34 below the \$17.75 average for the remaining 170 dairy farms.

Tables 49 through 51 show progress of the farm businesses that have participated in DFBS in each of the last five years for three herd size groups.

A detailed list of accrual expenses, receipts and a profitability analysis is presented in Table 52, on pages 53 and 54 for the seven herd size categories. Purchased feed is the largest expense on all farms, regardless of size. However, larger farms find hired labor expense as the second largest expense category.

Assets, liabilities and financial measures are presented in Table 53 on pages 55-58. All herd size categories saw an increase in net worth during 2010. The largest herd size category experienced an increase in net worth of \$962,958. However, percent equity went down as assets increased. The largest herds had the lowest percent equity; while the smaller herds averaged 79 percent.

Selected business factors by herd size group are presented in Table 54 on pages 59 and 60. George Warren, father of farm business management at Cornell, said in his 1918 farm management text, "No size of farm is large enough to ensure a profit." Therefore, larger farms are, on average, more profitable; but no farm is large enough to guarantee a profit. For a more detailed analysis of large herd farms, see Dairy Farm Business Summary, New York Large Herd Farms, 300 Cows or Larger, 2010. For analysis of smaller herds, see Dairy Farm Business Summary, New York Small Herd Farms, 120 Cows or Fewer, 2010. Both publications are available from Linda Putnam, Dyson School of Applied Economics and Management, Cornell University, 216 Warren Hall, Ithaca, New York 14853-7801; phone 607-255-8429; e-mail ldp2@cornell.edu. Visit the Charles H. Dyson School of Applied Economics and Management website <http://www.dyson.cornell.edu/outreach/> for a list of all department publications and a publication order form.

SUPPLEMENTAL INFORMATION

Comparisons of business performance by farms buying versus growing forages, types of housing and herd size, rotational grazers, milking frequency, same farms over 10 years, and dairy region are presented in this section. Farm receipts and expenses per cow and per hundredweight of milk sold for different levels of milk output and herd size groups, plus additional data, are included.

A word of caution to the reader on the interpretation of these data: It is the combination of resources and practices, and implementation of business management strategies by farmers that determine business performance. Examining one factor, while not holding all others constant, can lead to erroneous conclusions of cause and effect relationships. As an example, farms milking 3x per day showed higher profitability. Is it exclusively higher milking rates or is it that farms milking more frequently would have higher profitability per cow if they milked less often? Keep this distinction in mind when reviewing the following data.

Comparison for Farms That Buy All Feed Versus Farms That Grow Forages

Farms specializing in only milk production are a growing trend in New York. In 2010, 12 participating farms purchased the majority of their feed, including all forages. On average, only three acres of forage were harvested by these farms. Table 55 highlights the income and expenses for these 12 farms compared to the income and expenses for 130 farms of similar size that grew their forages. Table 56 compares selected business factors for the two groups of farms. In 2010, the 12 farms buying forages had, on average, higher labor and management incomes per operator, rates of return on equity capital, and rates of return on all capital than the similar size farms growing forages. While pounds of milk sold per cow were higher, milk receipts per cow and per hundredweight were lower, and operating costs of producing milk were \$0.52 per hundredweight higher than farms growing forages.

Comparison by Type of Barn and Herd Size

When analyzing a dairy farm business by comparing it to a group of farms, it is important that the group of farms have as many of the same physical characteristics as possible as the farm being analyzed. To assist in this endeavor, dairy farms in the summary have been divided into those with freestall and those with conventional housing. Conventional housing includes stanchion and tiestall barns. Within each group, is a further classification by size of the dairy herd. Table 57 on page 65 includes the average values for the resulting five groups of dairy farms. The average size in the five groups ranges from 47 cows on the small conventional farms to 952 cows on the largest freestall farms. The largest freestall farms averaged the highest milk output per cow and per worker, the lowest total cost of production and investment per cow; and, in 2010, they had the highest returns to labor, management and capital.

Farm business charts have been computed for each of the five housing and herd size categories and are on pages 66-70. By comparing the farm's performance on the most appropriate business chart, a farm manager will be better able to evaluate his or her business performance. Each column of the farm business chart is independent of the others.

Intensive Grazing Farms vs. Non-Grazing Farms

In 2010, 27 of the DFBS cooperators practiced intensive grazing. Intensive grazing means the dairy herd was on pasture for three months or more and was moved to a new paddock every third day or less and at least 30 percent of the forage was from pasture. The farms using intensive grazing are compared with a control group of non-grazing farms in Table 63. The control group is a selection of non-grazing dairy farms of similar size. In 2010, average profitability was higher on intensive grazing farms. Operating costs of producing milk were \$1.22 per hundredweight lower while total costs were the same as the costs of production on the control farms. A publication containing detailed information on New York farms using intensive grazing is available from the Dyson School of Applied Economics and Management. An order form is included on the department website: <http://www.dyson.cornell.edu/outreach/order.php> or contact Linda Putnam (e-mail: ldp2@cornell.edu, phone: 607-255-8429).

Comparison of Data, Same Farms, 2001 - 2010

Follow ten years of growth, change and progress made by 94 New York DFBS farms in Table 64, pages 72 and 73. Milk receipts per hundredweight are higher by only \$0.90 in 2010 when compared to 2001. Profitability in 2010 is higher than most years in the ten-year period. Care should be exercised in using these data to indicate change in the dairy industry since the composition of the sample of farms is different from the state as a whole, and there is considerable year-to-year variability in milk prices.

Receipts and Expenses per Hundredweight of Milk and Per Cow

Average accrual receipts and expenses per cow and per hundredweight of milk sold are listed for 46 dairy farms selling less than 19,000 pounds of milk per cow, 59 farms with 19,000 to 22,999 pounds of milk sold per cow, and 99 dairy farms selling 23,000 pounds and more in Table 65 on page 74. Table 66 on page 75 provides the list of average accrual receipts and expenses for 47 farms averaging less than 100 cows per farm, 42 farms with 100 to 200 cows and 115 farms with 200 cows or more.

These data are very useful for forward planning or budgeting when a farmer or planner does not have complete and accurate data from his or her own farm business. It is important to use the costs and returns per unit of output that most closely fit the level of production and herd size that is included in the plan. For example, an expansion budget for a 20,000 pound herd should include higher feed costs per cow than a budget for an 18,000 pound herd. Herds with more than 180 cows must budget for higher hired labor costs per cow than smaller herds. These data should also be adjusted to the operating characteristics of the farm being budgeted. Most farms are not average. It is always better to have data on the specific farm being budgeted.

Comparison of Dairy Farm Business Data by Region

Average farm business summary data from five regions of the State are compared in Tables 67 and 68. The Western and Central Plain Region averaged the highest profitability. The Northern New York Region averaged the largest average farm size; however, Western and Central Plain Region had the highest average rate of milk production. Dairy farmers in the Western and Central Plain Region have increased milk production 32.7 percent from 2000-2010 and they produced milk for an average total cost of \$16.83 per hundredweight in 2010. Total milk production has declined 3.7 percent from 2000-2010 in the Western and Central Plateau Region (Figure 2). However, this is the region with the highest return per hundredweight to labor, management and capital with \$3.53. Central Valleys Region had the second highest return per hundredweight to labor, management and capital with \$2.92.

Comparison of Farms by Milking Frequency

Forty-one percent of the 204 DFBS farms utilized three times per day (3X) milking in 2010. Most of the remaining farms milked twice per day (2X). Two years of selected average business and cost of milk production factors from the two milking frequency groups are compared in Table 69.

In 2010, the 3X farms averaged 51 more cows per farm, sold more milk per cow, showed an average \$846,024 increase in net farm income, and a decrease in total cost of producing milk by \$0.06 compared to the 3X farm averages for 2009. The 2X farms increased milk output per cow one percent, average net farm income increased by \$157,415, and total production costs increased by \$0.28 per hundredweight in 2010 compared to 2009.

The 3X farms averaged 25.6 percent more milk per cow and 44.9 percent additional milk per worker in 2010 compared with the 2X farms. Similar differences were found in 2009. In 2010, the average total cost of producing milk was 11.3 percent lower on 3X farms than on 2X dairies. On the average, farmers milking 3X sold more milk per cow and per worker, produced milk at lower costs per hundredweight and received higher returns for their labor, management and capital than the average dairy farmer milking 2X. However, milking frequency was not the only, and probably not the most important, factor that contributed to financial success on these dairy farms. Comparison of herd size, crop yields, labor and capital efficiency indicates there are other important management differences contributing to higher profits.

Other Comparisons

Twelve dairy renter farms (Table 70) were smaller, on average, and averaged lower labor and management incomes than the average for 204 owned dairy farms. A forthcoming publication contains detailed information on New York dairy renters (see <http://www.dyson.cornell.edu/outreach/order.php>). Data for the top 10 percent of farms by rate of return on all capital without appreciation are presented in Table 71. Additional data for the top 10 percent of farms are presented in many of the first 46 tables of this publication. Summary data for the 204 specialized dairy farms are presented in Table 72.

INTENSIVE GRAZING FARMS VS. NON-GRAZING FARMS
New York State Dairy Farms, 2010

Item	All Intensive Grazing Farms ⁶⁴	Non-Grazing Farms ⁶⁵
Number of farms	27	72
<u>Business Size & Production</u>		
Number of cows	134	138
Number of heifers	100	117
Milk sold, pounds	2,048,302	2,989,361
Milk sold per cow, pounds	15,231	21,697
Milk plant test, % butterfat ⁵	4.0%	3.7%
Cull rate	21%	33%
Tillable acres, total	299	366
Hay crop, tons DM per acre	2.2	2.8
Corn silage, tons per acre	19.7	18.7
Forage dry matter per cow, tons ⁶	4.5	8.8
<u>Labor & Capital Efficiency</u>		
Worker equivalent	2.97	3.97
Milk sold per worker, pounds	689,664	752,514
Cows per worker	45	35
Farm capital per worker	\$376,550	\$383,792
Farm capital per cow	\$8,316	\$11,059
Farm capital per cwt. milk	\$39	\$36
Machinery and equipment per cow	\$1,436	\$2,154
<u>Milk Production Costs & Returns</u>		
Selected costs per cwt.:		
Hired labor	\$1.62	\$1.88
Grain & concentrate	\$4.87	\$5.25
Purchased roughage	\$0.80	\$0.44
Replacements purchased	\$0.03	\$0.11
Vet & medicine	\$0.39	\$0.57
Milk marketing	\$1.05	\$0.91
Other dairy expenses	\$1.37	\$1.46
Operating cost of producing milk per cwt.	\$12.73	\$13.95
Total labor cost per cwt. (hired, family & operator)	\$4.04	\$3.99
Owner and operator resources per cwt.	\$4.20	\$3.85
Total cost of producing milk per cwt.	\$19.29	\$19.29
Average farm price per cwt.	\$17.39	\$16.74
<u>Related Cost Factors</u>		
Hired labor/cow	\$246	\$407
Total labor/cow	\$616	\$866
Purchased dairy feed/cow	\$865	\$1,235
Purchased grain & concentrate as % of milk receipts	30%	30%
Veterinary & medicine/cow	\$59	\$123
Machinery costs/cow	\$590	\$791
Feed & crop expenses/cwt.	\$6.82	\$6.73
<u>Profitability Analysis</u>		
Net farm income (with appreciation)	\$103,591	\$99,146
Net farm income (without appreciation)	\$77,240	\$71,665
Net farm income per cow (without appreciation)	\$574	\$520
Net farm income per cwt. (without appreciation)	\$3.77	\$2.40
Labor & management income per operator	\$22,765	\$7,382
Labor & management income per operator per cow	\$169	\$53
Rates of return on:		
Equity capital with appreciation	6.0%	3.0%
All capital with appreciation	5.6%	3.4%

⁶⁴Farms grazing at least three months of year, changing paddock at least every three days, forage from pasture at least 30 percent, and no organic farms.

⁶⁵Farms with similar herd size as the 27 rotational grazing farms.

⁶⁶Average of farms reporting this data.

⁶⁷Average of farms that grow forages.

Machinery depreciation	28,118				
Building depreciation	15,213				
TOTAL ACCRUAL EXPENSES	\$1,360,001				
<u>ASSETS</u>	<u>Jan. 1</u>	<u>Dec. 31</u>	<u>LIABILITIES</u>	<u>Jan. 1</u>	<u>Dec. 31</u>
Farm cash, checking & savings	\$20,824	\$10,274	Current	\$290,490	\$302,780
Accounts receivable	85,237	93,940	Intermediate ⁷⁴	404,492	337,607
Prepaid expenses	0	0	Long term ⁷³	177,917	237,061
Feed & supplies	112,043	142,569	Total Farm Liabilities	\$872,899	\$877,447
Livestock ⁷³	701,012	729,245	Nonfarm Liabilities ⁷⁵	0	0
Machinery & equipment ⁷³	260,877	284,881	Farm & Nonfarm Liabilities	\$872,899	\$877,447
Farm Credit stock	387	572	Farm Net Worth	\$554,883	\$671,156
Other stock & certificates	58,017	67,091	Farm & Nonfarm Net Worth	\$658,621	\$779,572
Land & buildings ⁷³	189,383	220,030			
Total Farm Assets	\$1,427,782	\$1,548,603			
Nonfarm Assets ⁷⁵	103,738	108,416			
Farm & Nonfarm Assets	\$1,531,520	\$1,657,019			

⁷²A renter owns no farm real estate or tillable land at the end of year.

⁷³Includes discounted lease payments.

⁷⁴Includes Farm Credit stock and discounted lease payments for cattle and machinery.

⁷⁵Average of 3 farms reporting.

NOTES

APPENDIX

**PRICES, COSTS AND TRENDS
IN THE NEW YORK DAIRY INDUSTRY**

The prices dairy farmers pay for a given quantity of goods and services has a major influence on farm production costs. The astute manager will keep close watch on unit costs and utilize the most economical goods and services.

Table A1.**PRICES PAID BY NEW YORK FARMERS FOR SELECTED ITEMS, 1996-2010**

Year	Mixed Dairy Feed 16% Protein ⁸² (\$/ton)	Fertilizer, Urea 45-46%N ⁸² (\$/ton)	Seed Corn, Hybrid ⁸³ (\$/80,000 kernels)	Diesel Fuel ⁸² (\$/gal)	Tractor 50-59 PTO ⁸³ (\$)	Wage Rate All Hired Farm Workers ⁸⁴ (\$/hr)
1996	\$226	\$328	\$77.70	\$1.020	\$20,600	\$7.19
1997	216	287	83.50	0.960	21,200	7.63
1998	199	221	86.90	0.810	21,800	7.63
1999	175	180	88.10	0.750	21,900	8.12
2000	174	201	87.50	1.270	21,800	8.74
2001	176	270	92.20	1.260	22,000	8.72
2002	178	232	92.00	1.028	21,900	9.26
2003	194	283	102.00	1.516	21,300	9.93
2004	207	299	105.00	1.400	21,500	9.96
2005	190	365	111.00	2.020	23,400	9.88
2006	207	403	118.00	2.350	23,700	10.35

⁸²Northeast region average. ⁸³United States average. ⁸⁴New York and New England combined.

Inflation, farm profitability, supply and demand all have a direct impact on the inventory values on New York dairy farms. The table below shows year-end (December) prices paid for dairy cows (replacements), an index of these cow prices, an index of new machinery prices (U.S. average), the average per acre value of farmland and buildings reported in January and an index of the real estate prices.

Table A2.**VALUES AND INDICES OF NEW YORK DAIRY FARM INVENTORY ITEMS, 1994-2010**

Year	Dairy Cows		Machinery ⁸⁵	Farm Real Estate ⁸⁶	
	Value/Head	1977=100	1977=100	Value/Acre	1977=100
1994	1,100	222	249	1,260	215
1995	1,010	204	258	1,280	218
1996	1,030	208	268	1,260	215
1997	980	198	276	1,250	213
1998	1,050	212	286	1,280	218
1999	1,250	253	294	1,340	228
2000	1,250	253	301	1,430	244
2001	1,600	323	312	1,520	259

SOURCE: USDA, NASS, ASB, Agricultural Prices.

⁸⁵United States average; 1995 - 2010 are estimated due to discontinuation of 1977=100 series.

⁸⁶New York average for 2000-2010 excludes Native American Reservation land.

Table A3.

NUMBER OF DAIRY FARMS AND MILK COWS BY SIZE OF HERD New York State, 2010^{87,88}				
Size of Herd	Farms		Milk Cows	
Number of Cows	Number	% of Total	Number	% of Total
1 – 29	950	18.6%	9,000	1.5%
30 – 49	900	17.6%	29,000	4.8%
50 – 99	1,750	34.3%	120,000	19.6%
100 – 199	855	16.8%	110,000	18.0%
200 – 499	400	7.8%	110,000	18.0%
500 – 749	118	2.3%	67,000	11.0%
750 – 999	45	0.88%	35,000	5.7%
1,000 – 1,499	48	0.94%	55,000	9.0%
1,500 – 1,999	17	0.33%	28,000	4.6%
2,000 or more	17	0.33%	48,000	7.8%
Total	5,100	100.0%	611,000	100.0%

⁸⁷This information on number of farms and number of cows by size of herd is derived from several sources:

- Dairy Statistics as published by the New York Agricultural Statistics Services for 2010.
- CAFO (Concentrated Animal Feeding Operations) permit reports for 2010. Some small CAFO farms (farms with 200 to 700 milk cows) have not applied for or updated the permit. Estimates for these farms were made so as to reflect the total number of dairy farms in New York State; revision from Census in certain size categories.

⁸⁸The author wishes to thank everyone who provided some data as well as providing valuable advice and perspectives. However, any errors, omissions or misstatements are solely the responsibility of the author, Professor George Conneman, **e-mail GJC4@cornell.edu.**

In 2010, there were 5,100 dairy farms in New York State, and 611,000 milk cows. The table above was prepared based on the NYASS data plus the CAFO permit filing for additional herd size categories, and estimates from the 2007 Census.

Eighty-seven percent of the farms (less than 200 cows per farm) had 44 percent of the milk cows. The remaining thirteen percent of the farms had 56 percent of the cows.

About 5 percent of the farms (those with 500 or more cows) had 38 percent of the cows.

Farms with less than 50 cows represent 36 percent of all farms but kept only 6 percent of the cows.

Farms with 1,000 or more cows represent about 1.6 percent of the farms but kept over 21 percent of the cows.

GLOSSARY AND LOCATION OF COMMON TERMS

Accounts Payable: Open accounts or bills owed to feed and supply firms, cattle dealers, veterinarians and other providers of farm services and supplies.

Accounts Receivable: Outstanding receipts from items sold or sales proceeds not yet received such as the payment for December milk sales received in January.

Accrual Accounting: (defined on page 9).

Accrual Expenses: (defined on page 11).

Accrual Receipts: (defined on page 11).

Annual Cash Flow Statement: (defined on page 18).

Appreciation: (defined on page 12).

Asset Turnover Ratio: (defined on page 42).

Available for Debt Service per Cow: Net cash available for debt service after deducting net personal withdrawals for family expenditures, divided by the average number of cows.

Average Top 10% Farms: Average of 20 farms with highest rate of return on all capital (without appreciation).

Balance Sheet: A "snapshot" of the business financial position at a given point in time, usually December 31. The balance sheet equates the value of assets to liabilities plus net worth.

Barn Types: Stanchion: cows are confined in a stall by a stanchion or neck chain. Freestall: cows move at will between open stalls and feeding areas. Combination: both stanchion and freestall barns used.

bST Usage: An estimate of percentage of herd that was injected with bovine somatotropin during the year.

Business Records: Account Book: any organized farm record book or ledger. Accounting Service: any hired recordkeeping service. On-Farm Computer: computerized business and financial records entered and kept on the farm. Other: accountant, recordkeeping association or no organized recordkeeping system.

Capital Efficiency: The amount of capital invested per production unit. Relatively high investments per worker with low to moderate investments per cow imply efficient use of capital. (See analysis, page 42).

Capital Investment: Commonly used as substitute term for farm capital or total farm assets.

Cash Flow: The movement of money in and out of the business over a given period of time, e.g. one year. (See Annual Cash Flow Statement, page 18).

Cash Flow Coverage Ratio: (defined on page 20).

Cash From Nonfarm Capital Used in the Business: Transfers of money from nonfarm savings or investments to the farm business where it is used to pay operating expenses, make debt payments and/or capital purchases.

Cash Paid: (defined on page 10).

Cash Receipts: (defined on page 11).

Change in Accounts Payable: (defined on page 11).

Change in Accounts Receivable: (defined under Accrual Receipts on page 11).

Change in Advanced Government Receipts: (defined under Accrual Receipts page 11).

Change in Inventory: (defined on page 10).

Corporation: Business is organized under state corporation law. Corporation is owned, operated, and managed by members of one or more farm families and owner/operators are corporate employees. Corporate accounts are modified to exclude operator wages' and other compensation from operating expenses for DFBS use.

Cost of Producing Milk, Whole Farm Method: A procedure used to calculate costs of producing milk on dairy farms without using enterprise cost accounts. All non-milk receipts are assigned a cost equal to their sale value and deducted from total farm expenses to determine the costs of producing milk. (see page 28).

Cost of Term Debt: A weighted average of the cost of borrowed intermediate and long term capital used on the farm. Calculate by multiplying end of year principal of each loan that is borrowed by the interest rate for each loan at that time. Add up each amount that is calculated for each loan and then divide by total amount of borrowed funds. Do not include accounts payable, operating debt or advanced government receipts. This information is found on pages 8 & 9 of the data entry form.

Culling Rate: Culling rate is calculated by dividing the number of animals that left the herd for culling purposes and that died, by the average number of milking and dry cows for the year

Current (assets and liabilities): Farm inventories and operating capital that usually turnover annually, and the debt expected to be repaid within 12 months.

Current Portion: Principal due in the next year for intermediate and long term debt.

Current Ratio: Measures the extent to which current farm assets, if liquidated, would cover current farm liabilities. Calculated as current farm assets at end year divided by current farm liabilities at end year.

Dairy Cash-Crop (farm): Operating and managing this farm is the full-time occupation of one or more people, cropland is owned but crop sales exceed ten percent of accrual milk receipts.

Dairy Farm Renter: (dairy-renter) - Farm business owner/operator owns no tillable land and commonly rents all other farm real estate.

Dairy Grain and Concentrate: All grains, protein supplements, milk substitutes, minerals and vitamins purchased and fed to the dairy herd.

Dairy Records: DHIC: Dairy Herd Improvement Cooperative official milk production records. Owner Sampler: weights and samples are taken by farmer but tested by DHIC. Other: all other methods used to obtain periodic production data on individual cows. None: no milk production records on individual cows.

Dairy Roughage: All hay, silage or other fodder purchased and fed to the dairy herd.

Death Rate: The percentage of the average number of milking and dry cows that died during the year.

Debt Coverage Ratio: (defined on page 20)

Debt Per Cow: Total end-of-year debt divided by end-of-year number of cows.

Debt to Asset Ratios: (defined on page 16).

Depreciation Expense Ratio: The percentage of total accrual receipts that is charged to depreciation expense (machinery and building).

Dry Matter: The amount or proportion of dry material that remains after all water is removed. Commonly used to measure dry matter percent and tons of dry matter in feed.

Equity Capital: The farm operator/manager's owned capital or farm net worth.

Expansion Livestock: (defined on page 9).

Farm Business Chart: (see definition and application on page 44).

Farm Capital: Average total farm assets.

Farm Debt Payments as Percent of Milk Sales: Amount of milk income committed to debt repayment, calculated by dividing planned debt payments by total milk receipts. A reliable measure of repayment ability, see pages 20 & 47.

Farm Debt Payments Per Cow: Planned or scheduled debt payments per cow represent the repayment plan scheduled at the beginning of the year divided by the average number of cows for the year. This measure of repayment ability is used in the Financial Analysis Chart on page 47.

Financial Lease: A long-term non-cancelable contract giving the lessee use of an asset in exchange for a series of lease payments. The term of a financial lease usually covers a major portion of the economic life of the asset. The lease is a substitute for purchase. The lessor retains ownership of the asset.

Hay Crop: All hay land, including new seedings, harvested once or more per year as hay or hay crop silage.

Hay Dry Matter: see Dry Matter.

Heifers: Female dairy replacements of all ages.

Hired Labor (expenses): All wages, non-wage compensation, payroll taxes, benefits, and perquisites paid employees.

Hired Labor Expense as % of Milk Sales: The percentage of the gross milk receipts that is used for labor expense. Divide accrual hired labor expense by accrual milk sales.

Hired Labor Expense per Hired Worker Equivalent: The total cost to the farm per hired worker equivalent. Divide accrual hired labor expense by number of hired plus family paid worker equivalents.

Income Statement: A complete and accurate account of accrual adjusted farm business receipts and expenses used to measure net income over a period of time such as one year or one month.

Intensive Grazing: The dairy herd is on pasture at least three months of the year, changing paddocks at least every three days and percent of forage from pasture is at least 30 percent.

Interest Expense Ratio: The percentage of total accrual receipts that is used for interest expense

Intermediate (assets and liabilities): Farm business property and associated debt that is turned over from one to ten years.

Labor and Management Income: (defined on page 13).

Labor and Management Income Per Operator: (defined on page 13).

Labor Efficiency: Production capacity and output per worker. (See analysis on pages 42 and 43).

Labor Force: Operator(s): Person or persons that run the farm and make the management decisions. An operator does not have to be a farm owner. Family Paid: all family members, excluding operators, that are paid for working on the farm. Family Unpaid: all family members, excluding the operators, that are not paid for farm work performed.

Liquidity: Ability of business to generate cash to make debt payments or to convert assets to cash.

Leverage Ratio: (defined on pages 16 and 47).

Long-Term (assets and liabilities): Farm real estate and associated debt with typical life of ten or more years.

Milk Marketing (expenses): Milk hauling fees and charges, co-op dues, milk advertising and promotion expenses.

Milking Frequency: 2X/day: all cows were milked two times per day for the entire year. 3X/day: all cows were milked three times per day for the entire year. Other: any combination of 2X, 3X, and more frequent milking.

Milking Systems: Bucket and Carry: milk is transferred manually from milking unit to pail to tank. Dumping Station: milk is dumped from milking unit into transfer station and then pumped to tank. Pipeline: milking units are connected directly to milk transfer lines. Herringbone, parallel, parabone, and rotary parlors are identified specifically. Other Parlors would include milking systems such as flat barn parlors.

Net Farm Income: (defined on page 12).

Net Farm Income from Operations Ratio: (defined on page 14)

Net Milk Income over Purchased Concentrate Per Cow: Milk receipts less milk marketing expense less purchased grain and concentrate expense, all divided by average number of cows.

Net Milk Receipts: The mail box price received by farmers before any farmer authorized assignment or deductions.

Net Worth: The value of assets less liabilities equal net worth. It is the equity the owner has in owned assets.

Nondairy Feed: All grain, concentrates, and roughage purchased and fed to nondairy livestock.

Nonfarm Noncash Capital: (defined on page 11).

Nontillable Pasture: Permanent or semi-permanent pasture land that is not be included in a regular crop rotation.

Operating Costs of Producing Milk: (defined on page 31).

Operating Expense Ratio: The percentage of total accrual receipts that is used for operating expenses, excluding interest and depreciation.

Opportunity Cost: The cost or charge made for using a resource based on its value in its most likely alternative use. The opportunity cost of a farmer's labor and management is the value he/she would receive if employed in his/her most qualified alternative position.

Other Forage: All forage crops harvested but not included as hay crops or corn silage, e.g. oats, barley, and sudan grass harvested as roughage.

Other Livestock Expenses: All other dairy herd and livestock expenses not included in more specific categories. Other livestock expenses include; bedding, DHIC, milk house and parlor supplies, livestock board, registration fees and transfers.

Owner/Operator Resources Per Hundredweight: The total value of equity, management, and labor contributed to the farm from all owner/operators. This measure is calculated by adding the interest on equity capital to the value of labor and management for all owner/operators and dividing by the hundredweight milk produced during the year.

Part-Time Dairy (farm): Dairy farming is the primary enterprise, cropland is owned but operating and managing this farm is not a full-time occupation for one or more people.

Partnership: Business is owned by two or more individuals who share profits according to their contribution of labor, management, and capital.

Percent of Heifer Inventory Custom Inventory: The percent of current heifer inventory owned by the farm that is being custom raised off the farm.

Percent of Replacements Purchased: The percent of animals in the herd that calved for replacement purposes (not expansion cattle) that were different genetic background than your herd and were purchased.

Personal Withdrawals and Family Expenditures Including Nonfarm Debt Payments: All the money removed from the farm business for personal or nonfarm use including family living expenses, health and life insurance, income taxes, nonfarm debt payments, and investments.

Premium: In milk marketing this typically refers to the amount paid for milk in addition to the minimum regulated price. Premiums may be paid to the producer or cooperative supplier of milk by a buyer depending on a variety of criteria such as milk quality, composition, quantity supplied, or services provided. They may also represent market supply/demand conditions not adequately accounted for in the regulated price.

Prepaid Expenses: (defined on page 11).

Producer Price Differential: Under Federal Order markets with multiple component pricing, it is the residual value (per hundredweight) of the pool after deducting component payments (protein, butterfat, and other solids) to producers. This residual value will vary between market orders and from month-to-month based on the utilization of the various classes and class price. It is possible that the PPD can even be negative at times if, for example, the class III price exceeds the class I price.

Profitability: The return or net income the owner/manager receives for using one or more of his or her resources in the farm business. True "economic profit" is what remains after deducting all costs including the opportunity costs of the owner/manager's labor, management, and equity capital.

Purchased Inputs Costs of Producing Milk: (defined on page 31).

Repayment Analysis: An evaluation of the business' ability to make planned debt payments.

Replacement Livestock: Dairy cattle and other livestock purchased to replace those that were culled or sold from the herd during the year.

Return on Equity Capital: (defined on page 14).

Return to all Capital: (defined on page 14).

Sell Rate: The percentage of the average number of milking and dry cows that were sold for culling reasons. Animals that were sold as replacement stock to other dairy farms is not included in this number.

Sole Proprietorship: Business is owned by one individual but there may be more than one operator.

Solvency: The extent or ability of assets to cover or pay liabilities. Debt/asset and leverage ratios are common measures of solvency.

Specialized Dairy Farm: A farm business where dairy farming is the primary enterprise, operating and managing this farm is a full-time occupation for one or more people and cropland is owned.

Statement of Owner Equity (reconciliation): (defined on page 17).

Stocking Rate: (defined on page 23).

Taxes (expenses): Real estate taxes (school, town, and county). Payroll taxes are included as a hired labor expense. Income and self-employment taxes are a personal expense for all non-corporate taxpayers.

Tillable Acres: All acres that are normally cropped including hay land that is pastured. Acres that are doubled cropped are counted once.

Tillable Pasture: Hay crop acreage currently used for grazing that could be tilled in a regular cropping sequence.

Total Costs of Producing Milk: (defined on page 31).

Value of Calf Sold: The average value received for bull and heifer calves sold as calves during the year.

Value of Cow Sold: The average value received for animals that were sold for culling reasons.

Whole Farm Method: A procedure used to calculate costs of producing milk on dairy farms without using enterprise cost accounts. All non-milk receipts are assigned a cost equal to their sale value and deducted from total farm expenses to determine the costs of producing milk.

Worker Equivalent: The number of full-time workers equivalent to all the full and part-time people working throughout the year. Operator and family labor is included. Worker equivalents are determined by converting all work to full-time months (based on a 230 hours per month) and dividing by 12.

Working Capital: A theoretical measure of the amount of funds available to purchase inputs and inventory items after the sale of current farm assets and payment of all current farm liabilities. Calculated as current farm assets at end year less current farm liabilities at end year.
